II. EMISSION SPECTRA 2000–10,000 A (Continued)

PROMETHIUM

The following list of lines in the emission spectrum of promethium ($_{61}Pm^{147}$) is based on the determinations of Meggers, Scribner and Bozman, Jour. of Res. Bureau of Standards **46,** 85, 1951. Intensities are given on a relative scale. In addition to abbreviations given at the beginning of the table the following are used in this list:

c = complex; h = hazy

Wave length	Arc and spark	Wave length	Arc and spark	Wave length	Arc and spark	Wave length	Arc and spark

II. EMISSION SPECTRA 2000–10,000 A (Continued)

Spectra of Heavy Elements

Abridged from Tomkins and Fred, Journal of the Optical Society of America **39**, 357, 1949

Spectra were obtained by the copper spark method. Intensities were obtained as the reciprocal of the limiting dilution at which lines would be visually observed.

Abbreviations:

n	Nebulous or diffuse
P	Most sensitive of the persistent lines
w or vw	Showing hyperfine structure

SECTION III

Infrared above 10,000 Angstroms

Wave lengths are given in angstroms

Intensities are shown by the numbers 1 to 10 except where otherwise indicated.
Characteristics of lines are indicated by symbols as follows: 2, 3, 4, etc. unresolved line of 2, 3, or 4 components.

I, II, III, etc. classes of spectra emitted by the neutral, ionized, or doubly ionized atom respectively.

b	widened, not sharp
c	complex, hyperfine structure
d	double
h	hazy
H	very hazy
l	shaded or displaced to longer wave lengths
r	narrow, self reversed
v	violet, shaded or displaced to shorter wave lengths
w	wide, hyperfine structure
W	very wide, hyperfine structure

Iron, Wave Lengths in the Ultraviolet Spectrum

The following table presents the results of interferometer measurements made by Meggers and Humphreys and reported in the Jour. Research of B. of S. **18**, 543, 1937. The standard iron arc was used as a source and the wave lengths in air at 15°C. and 76 mm are given in international Ångströms.

Iron, Wave Lengths in the Infrared

From interferometer measurements by Meggers, Jour. Research of B. of S. **14,** 33, 1935. The integrated light from the iron arc was used as a source. Wave lengths in air at 15°C and 760 mm are given as well as the intensity.

λ_{air} A	Intensity	λ_{air} A	Intensity	λ_{air} A	Intensity

Neon

From Meggers and Humphreys, Jour Research of B. of S **13.** 293, 1934. The source was an "end on" Geissler tube. Values are given for the wave length in air at 15°C and 760 mm pressure, and referred to the primary standard (Cd 6438.4696 A) and also to the red lines of neon. For complex lines the value for the principal component is given.

PERSISTENT LINES OF THE ELEMENTS

Spectra of the neutral atom, the singly ionized atom, and the doubly ionized atom are indicated by I, II, and III, respectively. The most sensitive lines are indicated by an asterisk (*). The symbol "D" preceding the intensity indicates the discharge-tube spectrum. Wave lengths are given in International Ångstrom units.

Wave lengths and intensities of lines between 2000 and 9999 ångstroms have been given according to the M.I.T. Wavelength Tables.

INDEX OF REFRACTION

INDEX OF REFRACTION

Indices of refraction for elements, inorganic, metal-organic and organic compounds and minerals will be found in the tables of physical constants for the various classes of substances in the section Properties and Physical Constants.

Values for compounds not there listed and data subsequently collected are given below.

Indices not otherwise indicated are for sodium light, λ = 589.3 mμ. Other wave lengths are indicated by the value in millimicrons or symbol in parentheses which follows the index. Wave lengths are indicated as follows: He, λ = 587.6 mμ; Li, λ = 670.8 mμ; Hg, λ = 579.1 mμ; A, λ = 759.4 mμ; C, λ = 656.3 mμ; D, λ = 589.3 mμ; F, λ = 486.1 mμ.

Temperatures are understood to be 20°C for liquids, or ordinary room temperatures in the case of solids. Other temperatures appear as superior figures with the index.

Indices for the elements and inorganic compounds will be understood to be for the solid form except as indicated by the abbreviation liq.

ELEMENTS

See also under Physical Constants of Inorganic Compounds and Index of Refraction of Gases.

Name	Formula	Index
Bromine (liq.)	Br_2	1.661^{15}
Cadmium (liq.)	Cd	0.82 (579 mμ)
(sol.)		1.12
Chlorine (liq.)	Cl_2	1.385
" (gas)		1.000768
Hydrogen (liq.)	H_2	$1.0974^{-252.83}$(579 mμ)
Iodine (sol.)	I_2	3.34
(gas)		1.001920
Lead	Pb	2.6 (579 mμ)
Mercury (liq.)	Hg	1.6–1.9
Nitrogen (liq.)	N_2	1.2053^{-190}
Oxygen (liq.)	O_2	1.221^{-181}
Phosphorus (yel.) (sol.)		2.1442^{25}
Selenium	Se_8	3.00, 4.04
" (amor.) (sol.)		2.92
Sodium (liq.)	Na	0.0045
(sol.)		4.22
Sulfur (liq.)	S_8	1.929^{110}
" (amor.) (sol.)		1.998
" (rhombic, α)		1.957, 2.0377, 2.2454
Tin (liq.)	Sn	2.1

INORGANIC COMPOUNDS

See also under Physical Constants of Inorganic Compounds.

Aluminum carbide	Al_4C_3	2.7, 2.75 (700 mμ)
chloride	$AlCl_3.6H_2O$	1.560, 1.507
oxide	Al_2O_3	1.665–1.680, 1.63–1.65
Alums. See under appropriate element.		
Ammonium antimonyl tartrate	$2(NH_4.SbO.C_4H_4O_6).H_2O$	β1.6229 (C)
*ortho*arsenate, di-H	$NH_4H_2AsO_4$	1.5766, 1.5217
bromide	NH_4Br	1.7108
*per*chlorate	NH_4ClO_4	1.4818, 1.4833, 1.4881
chloroplatinate	$(NH_4)_2PtCl_6$	1.8
fluoride	NH_4F	$\omega < 1.328$
" acid	NH_4HF_2	1.385, 1.390, 1.39
hydrogen malate (*d*)	$NH_4C_4H_5O_5$	β1.503
nitrate	NH_4NO_3	1.413, 1.611(He), 1.63

Name	Formula	Index
Ammonium sulfate, acid	NH_4HSO_4	1.463, 1.473, 1.510
tartrate (*dl*)	$(NH_4)_2C_4H_4O_6.2H_2O$	β1.564
thiocyanate	NH_4CNS	1.546, 1.685, 1.692
uranyl acetate	$NH_4C_2H_3O_2.UO_2(C_2H_3O_2)_2$	1.4808, 1.4933
Antimony bromide	$SbBr_3$	>1.74+
iodide, tri-	SbI_3	2.78 (Li), 2.36
Barium cadmium bromide	$BaCdBr_4.4H_2O$	β1.702
cadmium chloride	$BaCdCl_4.4H_2O$	β1.651
calcium propionate	$BaCa_2(C_3H_5O_2)_6$	1.4442
fluochloride	$BaCl_2.BaF_2$	1.640, 1.633
fluoride	BaF_2	1.475 also 1.4741
Barium oxide	BaO	1.980
*ortho*phosphate, di-	$BaHPO_4$	1.617, 1.63±, 1.635
propionate	$Ba(C_2H_5CO_2)_2.H_2O$	β1.5175
sulfide, mono-	BaS	2.155
Cadmium ammonium chloride	$CdCl_2.4NH_4Cl$	1.6038, 1.6042
cesium sulfate	$CdSO_4.Cs_2SO_4.6H_2O$	1.498, 1.500, 1.506
fluoride	CdF_2	1.56
magnesium chloride	$(CdCl_2)_2.MgCl_2.12H_2O$	1.49, 1.5331, 1.5769
oxide	CdO	2.49 (Li)
potassium chloride	$CdCl_2.4KCl$	1.5906, 1.5907
" cyanide	$Cd(CN)_2.2KCN$	1.4213
rubidium sulfate	$CdSO_4.Rb_2SO_4.6H_2O$	1.4798, 1.4848, 1.4948
Calcium aluminate	$Ca_3Al_2O_6$	1.710
borate	$CaO.B_2O_3$	1.540, 1.656, 1.682
carbide	CaC_2	>1.75
copper acetate	$CaCu(C_2H_3O_2)_4.6H_2O$	1.436, 1.478
cyanamide	$CaCN_2$	1.60, >1.95
dithionate	$CaS_2O_6.4H_2O$	1.5516, 1.5414
*pyro*phosphate	$Ca_2P_2O_7$	1.585, 1.60±, 1.605
platinocyanide	$CaPt(CN)_4.5H_2O$	1.623, 1.644, 1.767
strontium propionate	$Ca_2Sr(C_3H_5O_2)_6$	1.4871, 1.4956
sulfide (oldhamite)	CaS	2.137
sulfite	$CaSO_3.2H_2O$	1.590, 1.595, 1.628
thiosulfate	$CaS_2O_3.6H_2O$	1.545, 1.560, 1.605
Carbon dioxide (liq.)	CO_2	1.195^{15}
Cerium dithionate	$Ce_2(S_2O_6)_3.15H_2O$	β1.507
Cesium *per*chlorate	$CsClO_4$	1.4752, 1.4788, 1.4804
nitrate	$CsNO_3$	1.55, 1.56
selenate	Cs_2SeO_4	1.5989, 1.5999, 1.6003
thallium chloride	$Cs_3Tl_2Cl_9$	1.784, 1.774
Chromium cesium sulfate	$CrCs(SO_4)_2.12H_2O$	1.4810
oxide (ic)	Cr_2O_3	2.5
potassium cyanide (ic)	$CrK_3(CN)_6$	1.5221, 1.5244, 1.5373
sulfate (ic)	$Cr_2(SO_4)_3.18H_2O$	1.564
thallium sulfate	$CrTl(SO_4)_2.12H_2O$	1.5228
Cobalt acetate	$Co(C_2H_3O_2)_2.4H_2O$	β1.542
aluminate (Thenard's Blue)	$Co(AlO_2)_2$	>1.78 (red), 1.74 (blue)
ammonium selenate	$CoSeO_4.(NH_4)_2SeO_4.6H_2O$	1.5246, 1.5311, 1.5396
cesium sulfate	$CoCs_2(SO_4)_2.6H_2O$	1.5057, 1.5085, 1.5132
chloride (ous)	$CoCl_2.2H_2O$	<1.625, <1.671, >1.67
potassium selenate	$CoSeO_4.K_2SeO_4.6H_2O$	1.5135, 1.5195, 1.5358
rubidium sulfate	$CoSO_4.Rb_2SO_4.6H_2O$	1.4859, 1.4916, 1.5014
selenate	$CoSeO_4.6H_2O$	β1.5225, γ1.5227
Copper ammonium selenate	$CuSeO_4.(NH_4)_2SeO_4.6H_2O$	1.5213, 1.5355, 1.5395
ammonium sulfate	$CuSO_4.(NH_4)_2SO_4.6H_2O$	1.4910, 1.5007, 1.5054
cesium sulfate	$CuSO_4.Cs_2SO_4.6H_2O$	1.5048, 1.5061, 1.5153
chloride (ic)	$CuCl_2.2H_2O$	1.644, 1.684, 1.742
formate	$Cu(CHO_2)_2.4H_2O$	1.4133, 1.5423, 1.5571

ORGANIC COMPOUNDS

See also under Physical Constants of Organic Compounds.

Name	Index
Allontoin, solid	α1.579, γ1.660
Dimethyl thiophene (α, α′), liq	$1.51693^{13.4}$ (He)
" " (β, β′), liq	1.52217^{15} (He)
Ethyl carbylamine, liq	1.3659^{24}
Ethylidene cyanhydrin, liq	$1.40582^{18.4}$
Hexyl acetylene (n), liq	$1.4208^{12.5}$

MISCELLANEOUS

Albite glass	1.4890	Magdala red	1.90
Amber	1.546	Obsidian	1.482–1.496
Anorthite glass	1.5755	Paraffin	$1.43295^{38.3}$ (C)
Asphalt	1.635	Quartz, fused	1.45640 (656 mμ)
Bell metal	1.0052		1.45843 (589 mμ)
Borax, amorphous, fused	1.4630		1.46190 (509 mμ)
Canada balsam	1.530		1.47503 (361 mμ)
Ebonite	1.66 (red)		1.49634 (275 mμ)
Fuchsin	2.70		1.53386 (214 mμ)
Gelatin, Nelson's No. 1	1.530		1.57464 (185 mμ)
Gelatin, various	1.516–1.534	Resin, aloes	1.619 (red)
Gum Arabic	1.480 (1.514) (red)	colophony	1.548 (red)
		copal	1.528 (red)
Hoffman's violet	2.20	mastic	1.535 (red)
Ivory	1.539, 1.541	Peru balsam	1.593
		Rubber (natural)	1.5191 (D line 25°C)

MOLECULAR REFRACTION

The molecular refraction of a substance may be computed by the following relation,—

$$N = \frac{M(n^2 - 1)}{d(n^2 + 2)}$$

where N is the molecular refraction for a specified wave length and temperature, M, the molecular weight, d, the density and n the refractive index for the specified conditions.

LIQUIDS FOR INDEX BY IMMERSION METHOD

Liquid	N_D 24° C
Trimethylene chloride	1.446
Cineole	1.456
Hexahydrophenol	1.466
Decahydronaphthalene	1.477
Isoamylphthalate	1.486
Tetrachloroethane	1.492
Pentachloroethane	1.501
Trimethylene bromide	1.513
Chlorobenzene	1.523
Ethylene bromide + Chlorobenzene	1.533
o-Nitrotoluene	1.544
Xylidine	1.557
o-Toluidine	1.570
Aniline	1.584
Bromoform	1.595
Iodobenzene + Bromobenzene	1.603
Iodobenzene + Bromobenzene	1.613
Quinoline	1.622
α-Chloronaphthalene	1.633
α-Bromonaphthalene + α-Chloronaphthalene	1.640–1.650
α-Bromonaphthalene + α-Iodonaphthalene	1.660–1.690
Methylene iodide + Iodobenzene	1.700–1.730
Methylene iodide	1.738
Methylene iodide saturated with sulfur	1.78
Yellow phosphorus, sulfur and methylene iodide (8:1:1 by weight)	2.06
Can be diluted with methylene iodide to cover range 1.74–2.06. For precautions in use, cf. West, Am. Mineral, **21**, p. 245–9 (1936).	

HEAVY LIQUIDS FOR MINERAL SEPARATION

Liquid	Density
Tetrabromethane (sym.) Can be diluted with carbon tetrachloride (1.595) or benzene (0.894).	2.964, 20°/4°
Methylene iodide Can be diluted with carbon tetrachloride or benzene.	3.325, 20°/4°
Thallium formate, aq Can be diluted with water.	3.5
Thallium malonate-thallium formate, aq Can be diluted with water.	4.9

For preparation and recovery of these liquids, cf. U. S. Bureau Mines. Rept. Inv. #2897 (1928).

INDEX OF REFRACTION OF WATER

Alcohol and Carbon Bisulfide

For sodium light, λ = .5893

INDEX OF REFRACTION OF GLASS (Continued)

Index of refraction of optical glass made at the Bureau of Standards.
Composition refers to the raw material combined, not to the finished glass.

OPTICAL CONSTANTS OF METALS

The following table gives the refractive index n, the absorption index k, the angle of principle incidence $\overline{\phi}$, the angle of principle azimuth $\overline{\psi}$ and the percent of light reflected R.

The reduction of amplitude of the wave of the wave length λ after traveling any distance d in the medium is given by the ratio $1 : e^{\frac{2\pi dk}{\lambda}}$. $\overline{\phi}$ is the angle of incidence for which the phase change between the two rectangular components vibrating in and normal to the plane of incidence is 90°. $\overline{\psi}$ is the azimuth at which circularly polarized light results. These quantities are connected by the following relations

$$k = \tan 2\overline{\psi}(1 - \cot^2 \overline{\phi}), \qquad n = \frac{\sin \overline{\phi} \tan \overline{\phi}}{(1+k^2)^{\frac{1}{2}}}(1 + \tfrac{1}{2} \cot^2 \overline{\phi})$$

DISPERSION

The dispersion for various types of optical glass is shown in the following table. n_D =index of refraction for the D line (of the solar spectrum) and n_F and n_C the index for the F and C lines respectively ($n_F - n_C$) shows the dispersion for these two wave lengths.

Glass.	n_D	$(n_F - n_C)$
Light phosphate crown	1.5159	.00737
Barium-silicate crown	1.5399	.00909
High-dispersion crown	1.5262	.01026
Borate flint	1.5686	.01102
Extra light flint	1.5398	.01142
Heavy flint	1.7174	.02434
Heaviest flint	1.9626	.04882

INDEX OF REFRACTION OF AIR (15°C, 76 cm Hg)

Corrections for reducing wavelengths and frequencies in air (15°C, 76 cm Hg) to vacuo

The indices were computed from the Cauchy formula $(n - 1)10^7 = 2726.43 + 12.288/(\lambda^2 \times 10^{-8}) + 0.3555/(\lambda^4 \times 10^{-16})$. For 0°C and 76 cm Hg the constants of the equation become 2875.66, 13.412 and 0.3777 respectively, and for 30°C and 76 cm Hg 2589.72, 12.259 and 0.2576. Sellmeier's formula for but one absorption band closely fits the observations: $n^2 = 1 + 0.00057378\lambda^2/(\lambda^2 - 595260)$. If $n - 1$ were strictly proportional to the density, then $(n - 1)_0/(n - 1)t$ would equal $1 + \alpha t$ where α should be 0.00367. The following values of α were found to hold:

λ	0.85μ	0.75μ	0.65μ	0.55μ	0.45μ	0.35μ	0.25μ
α	0.003672	0.003674	0.003678	0.003685	0.003700	0.003738	0.003872

The indices are for dry air (0.05 ± % CO_2). Corrections to reduce to dry air the indices for moist air may be made for any wavelength by Lorenz's formula, $+0.000041(m/760)$, where m is the vapor pressure in mm. The corresponding frequencies in waves per cm and the corrections to reduce wavelengths and frequencies in air at 15°C and 76 cm Hg pressure to vacuo are given. E.g., a light wave of 5000 angstroms in dry air at 15°C, 76 cm Hg becomes 5001.391 A in vacuo; a frequency of 20,000 waves per cm correspondingly becomes 19994.44.

Wave-length, λ angstroms	Dry air $(n-1) \times 10^7$ 15°C 76 cm Hg	Vacuo correction for λ in air $(n\lambda - \lambda)$ add	Frequency waves per cm $\frac{1}{\lambda}$ in air	Vacuo correction for $\frac{1}{\lambda}$ in air $\left(\frac{1}{n\lambda} - \frac{1}{\lambda}\right)$ subtract	Wave-length, λ angstroms	Dry air $(n-1) \times 10^7$ 15°C 76 cm Hg	Vacuo correction for λ in air $(n\lambda - \lambda)$ add	Frequency waves per cm $\frac{1}{\lambda}$ in air	Vacuo correction for $\frac{1}{\lambda}$ in air $\left(\frac{1}{n\lambda} - \frac{1}{\lambda}\right)$ subtract

COEFFICIENT OF TRANSPARENCY OF UVIOL GLASS FOR THE ULTRA-VIOLET

For a thickness of 1 mm.

Wave length, microns	0.280	0.309	0.325	0.346	0.361	0.383	0.397
Uviol crown	0.56	0.95	0.990	0.996	0.999	1.000	1.000

REFLECTION OF LIGHT BY GLASS IN AIR

The table gives the percentage *R* of light reflected by one surface of glass having a refractive index of 1.55 relative to air. The angle of incidence is *i*, and the angle of refraction is *r*. The two components of the polarized light are marked $\parallel$ and $\perp$ according to the electric vector of the vibration. (Computed according to Fresnel's formula.)

i	*r*	$\parallel$	$\perp$	*R*
0	0° 0′	4.65	4.65	4.65
10	6° 26′	4.84	4.47	4.66
20	12° 45′	5.45	3.92	4.68
30	18° 49′	6.64	3.00	4.82
40	24° 30′	8.77	1.75	5.26
50	29° 37′	12.54	0.46	6.50
60	33° 58′	19.35	0.12	9.73
70	37° 19′	31.99	4.00	18.00
80	39° 27′	55.74	23.34	39.54
90	40° 11′	100.00	100.00	100.00

REFLECTION BY TRANSPARENT MEDIA IN AIR

For Normal Incidence

The table gives the per cent of the normally incident light which is reflected by transparent media of various indices of refraction. *n* = index of refraction, *R* = reflected light, *i* = angle of incidence = 0.

(Computed from Fresnel's formula.)

n	*R*	*n*	*R*	*n*	*R*
1.0	0.00	1.7	6.72	2.4	17.0
1.1	0.23	1.8	8.16	2.5	18.4

TEMPERATURE CORRECTIONS

Below 20°C the correction should be subtracted from the per cent sugar. Above 20°C the correction is to be added to the per cent sugar.

INDEX OF REFRACTION OF MALTOSE HYDRATE SOLUTIONS

McDonald: Journal of Research of the National Bureau of Standards, Vol. **46,** 165, 1951

The following table gives the refractive index of maltose solutions for $\lambda = 5893$ A at 20° and 25°C.

Percent	n_D^{20}	n_D^{25}	Δn	$\Delta n/\Delta t$
1	1.33438	1.33389	0.00049	0.00010

DIFFUSE REFLECTING POWER

The diffuse reflecting power, or ratio of total luminous flux reflected to that received, measured for the various regions of the spectrum. The wave lengths given are those of maximum energy. — Coblentz, Bulletin, 196, Bureau of Standards 1912.

DIFFUSE REFLECTING POWER (Continued)

The diffuse reflecting power, or ratio of total luminous flux reflected to that received, measured for the various regions of the spectrum. The wave lengths given are those of maximum energy. — Coblentz, Bulletin, 196, Bureau of Standards 1912.

Spectral Emissivity of Oxides

The emissivity of oxides and oxidized metals depends to a large extent upon the roughness of the surface. In general, higher values of emissivity are obtained on the rougher surfaces.

Material	Range of observed values	Probable value for oxide formed on smooth metal	Material	Range of observed values	Probable value for oxide formed on smooth metal
Aluminum oxide	0.22–0.40	0.30	Alumel (oxidized)	....	0.87

PIGMENTS AND DYES

The tables which follow give the fraction of incident light reflected by pigments or transmitted by dyes. The pigments were in dry powdered form and the dye solutions, except where indicated, in distilled water. Wave lengths are given in microns.

TRANSMISSION OF COLORED GLASSES

If I_o is the intensity of radiation entering a layer of some medium and I the intensity reaching the opposite surface, the ratio I/I_o is called the transmittance. In practice the ratio of intensity of radiation passing through a glass sample to that incident on its surface is often measured and plotted as transmission. The transmission is the result of two factors, the transmittance of the glass and the losses by reflection. These losses amount to about 4% for each glass-air surface; the transmission of a sample is about 92% of its transmittance. Since the reflection losses differ slightly with different samples, the correction is often determined and applied when the transmission is measured. Values which are thus corrected are marked * at the head of the column.

In order to obtain the transmittance for thicknesses other than those listed it is convenient to transform the tabular values to terms of βt in the equation $I/I_o = e^{\beta t}$ where t is the thickness (in millimeters) and β a constant for a particular sample. The base 10 is conveniently used in place of e so that βt becomes the common logarithm of the transmittance, or $\beta t = \log I/I_o$. Using the corrected value of the transmittance for a specific thickness, found in the table, the value of βt may be found, changed to the value for the new thickness and the transmittance for the second thickness computed.

For example: The tabular value of transmission for sample **CG** 396 at $\lambda = .46\mu$ is given as 0.80 for a thickness of 2 mm. It is desired to find the transmittance for 5 mm.

The corrected value of the transmittance for 2 mm is 0.80/.92 or about 0.871. Log .871 = 9.94002–10. Writing this as a wholly negative number the equation becomes $\beta t = -.05998$. For $t = 5$ $\beta t = -.05998 \times 5/2 = -.14995$ or changing to the more familiar form gives 9.85005–10 which is the logarithm of the new transmittance which is found to be .708. The transmission will be .92 × .708 or .651.

In order to identify the glasses listed, the manufacturer's number is given preceded by an abbreviation of the maker's name, as follows: **AO,** American Optical Co.; **BL,** Bausch & Lomb Optical Co.; **CE,** Chicago Eye Shield Co.; **CG,** Corning Glass Works. Data for Jena glasses are given separately in section II of the table.

This table has been compiled with the assistance of: Mr. H. P. Gage, Corning Glass Works; Mr. J. Liautaud, Chicago Eye Shield Co.; Mr. W. B. Rayton, Bausch & Lomb Optical Co.; Mr. A. J. Weinstein of the Fish-Shurman Corporation.

TRANSMISSION OF WRATTEN FILTERS

Compiled by Allie C. Peed, Jr. for The Eastman Kodak Company

Data condensed from Kodak Wratten Filters for Scientific and Technical Use published by the Eastman Kodak Company, manufacturers of the filters.

The following pages give (1) percentage luminous transmittance at wave lengths from 400 to 700μ at intervals of 10μ for the standard illuminant "C" adopted by the International Commission of Illumination, (2) dominant wave length in millimicrons, and (3) percentage of excitation purity. Values of wave length followed by "c" indicate the complementary wave lengths of purple filters which do not have a dominant wave length.

All colorimetric specifications are based on the 1931 standard ICI colorimetric and luminosity data.

The transmittance data are given as representing standard samples of the filters. They are intended only for the information of users in choosing filters which will meet their requirements. Values taken from the tables of data should not be used by research workers as representing precisely the absorption characteristics of a particular filter. If such precise data are needed, they should be determined for the particular filter being used.

Where the spectra extend into the ultraviolet this fact is indicated by an asterisk (*) in the transmission tables immediately beneath the filter number, and quantitative data are not given. The manufacturer should be consulted for this information. Transmission in the ultraviolet of wave lengths less than 330μ will be eliminated in the case of cemented filters, as glass absorbs ultraviolet radiation of wave lengths shorter than about 330μ.

Stability ratings are given as three letter combinations following the filter description in the table below. In establishing the stability classifications each filter is exposed to a selected light source for a specific time interval. The following grading system is used to describe the result:

Class A—stable
Class B—relatively stable
Class C—somewhat unstable
Class D—unstable

The classification letters, for example, AAA, describe the stability to the following three exposure tests in this order:

1. Two weeks' exposure to daylight in a south window
2. Twenty-four hours' exposure to a "Fade-Ometer"
3. Two weeks' exposure at two feet from a 1000-watt tungsten lamp.

Filters are supplied in two forms; as lacquered gelatin film, or as a gelatin film cemented between pieces of optical glass. Filters in glass are cemented between sheets of plane-parallel glass, which is surfaced in quantities and is of sufficient accuracy for general photographic work, and for most scientific purposes.

Most Wratten Gelatin Filters are stocked in 2- or 3-inch squares. Stocks of 2- or 3-inch square filters cemented in glass are maintained only in filters usually used for general photographic work.

The booklet "Kodak Filters and Lens Attachments" gives more valuable information on this subject.

FILTER DATA

No.	Description, use, and stability
	Colorless
0	For compensating thickness of other gelatin filters in optical systems, AAA.
1	Absorbs ultraviolet below 360 mμ, DDD.
1A	Kodak Skylight Filter—Reduces excess bluishness in outdoor color photographs in open shade under a clear, blue sky, ACA.
	Yellows
2B	Absorbs ultraviolet below 410 mμ, ACA.
3	Light yellow, CCD.
3N5	No. 3 plus 0.5 neutral density, AAA.
4	Light yellow—Approximate correction on panchromatic materials for outdoor scenes, including sky, CCC.
6	K1—Light yellow—Partial correction outdoors, BBA.
8	K2—Yellow—Full correction outdoors on Type B panchromatic materials. Widely used for proper sky, cloud, and foliage rendering. Green separation for Fluorescence Process, AAA.

TRANSMISSION OF FILTERS (Continued)

No.	Description, use, and stability
8N5	No. 8 plus 0.5 neutral density, AAA.
9	K3—Deep yellow. Moderate contrast in outdoor photography (with black-and-white films), AAA.
11	X1—Greenish yellow. Correction for tungsten light on Type B panchromatic materials; also for daylight correction with Type C panchromatic materials in making outdoor portraits, darkening skies, or lightening foliage, AAA.
12	Minus blue. Haze cutting in aerial photography, AAA.
13	X2—Yellow green. Correction for Type C panchromatic materials in tungsten light, ABA.
15	G—Deep yellow. Overcorrection in landscape photography. Contrast control in copying and in aerial infrared photography, AAA.
16	Blue absorption, AAB.
18A	Transmits ultraviolet and infrared only (glass), AAA.
	Oranges and Reds
21	Blue and blue-green absorption, CBB.
22	Yellow-orange. For increasing contrast in blue preparations in microscopy. Mercury yellow, BAC.
23A	Light red. Two-color projection—contrast effects, BAB.
24	Red for two-color photography (daylight or tungsten). White-flame-arc tricolor projection, AAB.
25	A—Tricolor red for direct color separation. Contrast effects in commercial photography and in outdoor scenes. Two-color general viewing. Aerial infrared photography and haze cutting, AAA.
26	Stereo red, AAA.
29	Red color separation from transparencies and for the Kodak Fluorescence Process. Strong contrast effects. Copying blueprints. Tungsten tricolor projection, AAA.
	Magentas and Violets
30	Green absorption, BBC.
31	Green absorption, CCA.
32	Minus green, CCD.
33	Strong green absorption, CCB.
34	Violet, CDD.
34A	Blue separation—Kodak Fluorescence Process, DCC.
35	Contrast in microscopy, CDD.
36	Dark violet, CCC.
	Blues and Blue-greens
38	Red absorption, BCA.
38A	Red absorption. Increasing contrast in visual microscopy, BBB.
39	Contrast control in printing motion-picture duplicates (glass), AAA.
40	Green for two-color photography (tungsten), CBC.
44	Minus red—Two-color general viewing, DDD.
44A	Minus red, DDD.
45	Contrast in microscopy, DDD.
45A	Highest resolving power in visual microscopy, CDC.
46	Blue projection (experimental), DDD.
47	Tricolor blue for direct color separation and from Kodak Ektacolor Film for Dye Transfer. Contrast effects in commercial photography. Tungsten and white-flame-arc tricolor projection, BBC.
47B	Tricolor blue for color separation from transparencies and from Kodak Ektacolor Film for Graphic Arts, BBB.
48	Green and red absorption, CBC.
48A	Green and red absorption, AAB.
49	Dark blue, BCB.
49B	Very dark blue, BBB.
50	Very dark blue. Mercury violet, CCC.
	Greens
52	Light green, AAB.
53	Medium green, CCB.
54	Very dark green, AAA.
55	Stereo green, BBC.
56	Very light green, CBC.

TRANSMISSION OF FILTERS (Continued)

No.	Description, use, and stability
57	Green for two-color photography (daylight), CBC.
57A	Light green, BBC.
58	Tricolor green for direct color separation. Contrast effects in commercial photography and microscopy, BBC.
59	Green for tricolor projection (white-flame-arc), BBB.
59A	Very light green, BBB.
60	Green for two-color photography (tungsten), BDC.
61	Green color separation from transparencies and Kodak Ekta-color Film. Tricolor projection (tungsten), ABC.
64	Red absorption (light), CDB.
65	Red absorption, ADB.
65A	Red absorption, CCD.
66	Contrast effects in microscopy and medical photography, DDC.
67A	Red absorption (light). Two-color projection, CDC.
	Narrow-band
70	Dark red. Infrared photography. Color separation for Kodak Ektacolor Film (with tungsten), ABC.
72B	Dark orange-yellow, CCC.
73	Dark yellow-green, ABB.
74	Dark green. Mercury green, BBC.
75	Dark blue-green, ACC.
76	Dark violet (compound filter), DDD.
77	Transmits 546 mμ mercury line (glass plus gelatin), AAA.
77A	Transmits 546 mμ mercury line (glass plus gelatin), AAA.
	Photometrics
78	Bluish. Photometric filter (visual), BAB.
78AA	Bluish. Photometric filter (visual), BAA.
78A	Bluish. Photometric filter (visual), AAA.
78B	Bluish. Photometric filter (visual), AAA.
78C	Bluish. Photometric filter (visual), BAA.
86	Yellowish. Photometric filter (visual), BBA.
86A	Yellowish. Photometric filter (visual), AAA.
†86B	Yellowish. Photometric filter (visual), BCA.
†86C	Yellowish. Photometric filter (visual), AAA.
	Light Balancing
80A	For Kodachrome Film, Daylight Type, and photographic flood lamps, ABA.
81	Yellowish. For warmer color rendering.
81A	Yellowish. For Kodak Ektachrome Film, Type B, with photographic flood lamps.
81B	Yellowish. For warmer color rendering.
81C	Yellowish. For Kodachrome Film, Type A, with flash lamps.
81D	Yellowish. For Kodachrome Film, Type A, with flash lamps.
81EF	Yellowish. For Kodak Ektachrome Film, Type B, with flash lamps.
82	Bluish. For cooler color rendering.
82A	Bluish. For Kodachrome Film, Type A, with 3200 K lamps.
82B	Bluish. For cooler color rendering.
82C	Bluish. For cooler color rendering.
83	Yellowish. For 16 mm Commercial Kodachrome Film and daylight exposure, BBB.
85	Orange. For Type A Kodak color films and daylight exposure, BAA.
85B	Orange. For Kodak Ektachrome Film, Type B, and daylight exposure, BAB.
	Miscellaneous
79	Photographic sensitometry. Corrects 2360 K to 5500 K, AAA.
87	For infrared photography. Absorbs visual.
87C	Absorbs visual, transmits infrared.
88A	For infrared photography. Absorbs visual.
89B	For infrared photography, AAA.
90	Narrow-band viewing filter for judging brightness scale of scenes, CCD.
96	Neutral filters for controlling luminance, AAB.
97	Dichroic absorption, AAA.
102	Correction filter for Barrier-layer photocell, ABA.
106	Correction filter for S-4 type photocell, AAA.

TRANSMISSIBILITY FOR RADIATIONS

Ratio of the transmitted light to the incident light for a definite thickness of the substance, usually 1 cm.

GLASS.

Glass in general is opaque to the ultra-violet and infra-red. Uviol glass is transparent to the longer radiations of the ultra-violet.

Coefficient of transparency of glass for visible and ultra-violet radiations.

Wave length microns	Normal incidence, thickness 1 cm.								
	0.309	0.330	0.347	0.357	0.361	0.375	0.384	0.388	0.396

QUARTZ

Quartz is very transparent to the ultra-violet and to the visible spectrum, but opaque for the infra-red beyond 7.0μ.

(Pflüger.)

Wave length, microns	0.19	0.20	0.21	0.22
Transmission for 1 mm	.67	.84	.92	.94

FLUORITE

Fluorite is very transparent to the ultra-violet, nearly to 0.10μ. Coefficient of transparency at $\lambda = 186$ is found by Pflüger to be 0.80.

For the infra-red tne values are given in a table below.

TRANSMISSIBILITY FOR RADIATIONS (Continued)

ROCK SALT AND SYLVINE AND FLUORITE

TRANSPARENCY FOR THE INFRA-RED.

FLUORESCENCE

Gases and Vapors.

Gas or vapor.	Condition.	Excitation.	Color or wave length of emitted light.	Observer.
Iodine...	Vapor at ordinary temperature.	Mercury arc $\lambda = .546\mu$	Strongest bands $\lambda = .5460\mu, .5774\mu$ .5730, .5796	Wood, 1911
Mercury .	Vapor at ordinary temperature	Spark between aluminum electrodes	Broad band $\lambda = .5900 - .3000$	Wood, 1909
Oxygen ..	....	Mercury arc in quartz tube	Strongest lines $\lambda = .1849, .1851$ (ultra-violet)	Streubing, 1910
Potassium	Vapor, 300°–400° C.	White light	Many strong lines from .6416–.6768, strongest .6544 and .6584	Wood & Carter, 1908
Rubidium	Vapor, at 270° C.	White light (elec. arc)	Strong red band $\lambda = .6900 - .6620$.	Dunoyer, 1912
Sodium ..	Vapor at 350° C.	White light (elec. arc)	D, $\lambda = .5893$ (mean)	Dunoyer, 1912

FLUORESCENT SUBSTANCES

By Jack De Ment

The emission of light from matter under the influence of an exciting agent is termed fluorescence. When emission persists after removal of the exciting agent the process is termed phosphorescence. Both are practically identical, except in the duration of light emission, and may harmoniously be explained on the same basis. Luminescence is the term covering both phenomena although candoluminescence, emission due to incandescent heat, may also be included. Fluorescence is classified according to the exciting agent(s) and special terms are derived therefrom.

Excitation includes over 30 processes by which energy is introduced into, and/or released from, the luminescent system; visible light (photoluminescence); low temperature heat (thermoluminescence); friction (triboluminescence); cold (baroluminescence); ion streams (ionoluminescence); cathode rays (cathodoluminescence); crystallization (crystalloluminescence); sound waves (sonoluminescence); Hertzian waves; radioelement radiations, e.g., alpha, beta (positrons), and gamma rays (radio-luminescence, etc.); neutrons: metabolic processes (bioluminescence); and a large number and wide variety of chemical reactions (chemiluminescence); etc. Terms such as radiophotoluminescence and tribothermoluminescence denote the exciting action of more than one agent.

Ultraviolet light is used with most success in ordinary studies on luminescent substances. Most effectively suited for general excitation of inorganic chemicals, phosphors, certain minerals, etc., whose exact absorption characteristics are unknown, is short wavelength ultraviolet light (Hg = 2537A, resonance radiation) filtered through a medium (usually glass) possessing peak transmission in this region and minimal transmission elsewhere, especially in the visible. For general excitation of organic and metal-organic compounds, and a few minerals, as well as tissues, long wavelength (Hg = 3650A) radiation is employed. All ultraviolet light must be filtered before adequate results are obtained.

Slight discordance is noted in the fluorescence of certain substances, especially in minerals and impure inorganic chemicals. Fluorescence may be affected by purity, age and source of the compound, particle size, water-content, and the solvent and concentration of solute. A great many substances, however, emit characteristic fluorescence which serves for detection and estimation in extremely small amounts, particularly after treatment with solvents, acids, or alkalis. The science of fluorochemistry embraces the applications of fluorescence and ultraviolet light to chemistry. The references should be consulted for additional details on fluorescent chemicals and fluorochemical analysis.

The following table gives the character of fluorescence for various substances when excited by radiation of wave length 3650 angstrom units, except where otherwise noted.

Key to Abbreviations

acet	acetone	KOH	potassium hydroxide
alk	alkalis, alkaline	l	light
al	ethyl alcohol	m	medium
b	bright	oxid	oxidation
bz	benzene	oxy	oxyacids
d	dark	p	pale
dil	dilute	s	strong
dl	dull	sl	slight

COLORIMETRY

Selected from Judd, Jour. Opt. Soc. Amer. **23,** 359 (1933)

Recommendations of the International Commission on Illumination

Standard Illuminants

A. Gas-filled tungsten incandescent lamp of color temperature 2848° K.

B. Noon Sunlight. Lamp as above in combination with the Davis-Gibson filter for converting color temperature 2848° to 4800° K.

The filter is to be composed of a layer one centimeter thick of each of two separate solutions B_1 and B_2, contained in a double cell of colorless optical glass.

Solution B_1

Copper sulfate ($CuSO_4{\cdot}5H_2O$)	2.452	g
Mannite ($C_6H_8(OH)_6$)	2.452	g
Pyridine (C_5H_5N)	30.0	cc
Distilled water to make	1000	cc

Solution B_2

Cobalt ammonium sulfate ($CoSO_4{\cdot}(NH_4)_2SO_4{\cdot}6H_2O$)	21.71	g
Copper sulfate ($CuSO_4{\cdot}5H_2O$)	16.11	g
Sulfuric acid (density 1.835)	10.0	cc
Distilled water to make	1000	cc

C. Average Daylight. Lamp as in **A** in combination with Davis-Gibson filter for converting color temperature 2848° to 6500° K.

The filter is composed of a layer one centimeter thick of each of two separate solutions C_1 and C_2, contained in a double cell made of colorless optical glass.

Solution C_1

Copper sulfate ($CuSO_4{\cdot}5H_2O$)	3.412	g
Mannite ($C_6H_8(OH)_6$)	3.412	g
Pyridine (C_5H_5N)	30.0	cc
Distilled water to make	1000	cc

Solution C_2

Cobalt ammonium sulfate ($CoSO_4{\cdot}(NH_4)_2SO_4{\cdot}6H_2O$)	30.580	g
Copper sulfate ($CuSO_4{\cdot}5H_2O$)	22.520	g
Sulfuric acid (density 1.835)	10.0	cc
Distilled water to make	1000	cc

See R. Davis and K. S. Gibson Bur. Stds. Misc. Pub. No. 114, Jan. 1931 or Bur. Stds. Jour. Research **7,** 796 (1931).

Standard Coordinate System

The tristimulus system of color specification is based on four chosen stimuli consisting of homogeneous radiant energy of wave lengths

700.0 **546.1** **435.8**

mμ and of standard illuminant B (see above).

To establish the system of specification coordinates are assigned as follows:

Stimulus	x	y	z
700.0 mμ	0.73467	0.26533	0.00000
546.1 mμ	0.27376	0.71741	0.00883
435.8 mμ	0.16658	0.00886	0.82456
Standard illuminant B:	0.34842	0.35161	0.29997

The Standard Observer

The "standard observer" is determined below by the specification for the equal energy spectrum both in fractions, x, y, z of the total amount for each wave length interval of 5 mμ and directly $\bar{x}$, $\bar{y}$, $\bar{z}$. The fractional values are known as the **trilinear coordinates** or **trichromatic coefficients** of the spectrum; the direct values as the **distribution functions** or coefficients.

The sum of the trichromatic coefficients is unity, that is $x + y + z = 1$. Therefore the value of z may be and often is omitted from a specification.

Relative Visibility

The value of $\bar{y}$ given in the table is the standard visibility function or relative visibility.

Wave length mμ	Trichromatic coefficients			Distribution coefficients for equal energy			Wave length mμ
	x	y	z	$\bar{x}$	$\bar{y}$ (Rel. Vis.)	$\bar{z}$

SPECIFIC ROTATION

Specific rotation or rotatory power is given in degrees per decimeter for liquids and solutions and in degrees per millimeter for solids; + signifies right handed rotation, − left. Specific rotation varies with the wave length of light used, with temperature and, in the case of solutions, with the concentration. When sodium light is used, indicated by D in the wave length column, a value of λ = 0.5893 may be assumed.

Optical rotatory power for a large number of organic compounds will be found in the International Critical Tables, Vol. VII; for sugars, Vol. II.

* Varies greatly with temperature, solvent, and conc.

MAGNETO-OPTIC ROTATION

Revised by Park L. Turrill

Verdet's Constant: $\rho = \dfrac{\alpha}{tH \cos \theta}$

The specific power of magnetic rotation ρ, is expressed in the above formula, where α is the total angle of rotation in minutes, t the thickness of the substance in centimeters through which the light beam passes, H the magnetic field intensity in gauss, and θ the angle between the direction of the magnetic field and the path of light. Determinations made with sodium light. $\lambda_D = 5893$ Å.

Values from the Smithsonian Tables, the International Critical Tables, and the literature.

TRANSPARENCY TO OPTICAL DENSITY CONVERSION TABLE

Transparency of a layer of material is defined as the ratio of the intensity of the transmitted light to that of the incident light. Opacity is the reciprocal of the transparency. Optical density is the common logarithm of the opacity.

Thus,

$$\text{Transparency} = \frac{I_t}{I_i}$$

$$\text{Opacity} = \frac{1}{\text{Transparency}} = \frac{I_i}{I_t}$$

$$\text{Optical density} = \log_{10}\left(\frac{I_i}{I_t}\right)$$

where I_i = Intensity of incident light
I_t = Intensity of transmitted light.

DEFINITIONS AND FORMULAS

The chemical terms have been compiled with the collaboration of
B. Clifford Hendricks

AB-.—A prefix attached to the names of the practical electric units to indicate the corresponding unit in the cgs electromagnetic system (emu), e.g. abampere, abvolt.

Abcoulomb.—The abcoulomb, the emu of charge, is defined as the charge which passes a given surface in one second if a steady current of one abampere flows across the surface. Its dimensions are, therefore, $\text{cm}^{\frac{1}{2}}\,\text{gm}^{\frac{1}{2}}$, which differ from the dimensions of the statcoulomb by a factor which has the dimensions of a speed. This relationship is connected with the fact that the ratio $2K_e/K_m$ must have the value of the square of the speed of light in any consistent system of units. It follows further that

$$1 \text{ abcoulomb} = 2.998(10)^{10} \text{ statcoulomb},$$

the speed of light in vacuo being $2.998(10)^{10}$ cm/sec.

Abegg's rule.—For use in regard to a helical periodic system. If the maximum positive valence exhibited by an element be numerically added to its maximum negative valence, there is evidently a tendency for the sum to equal 8. This tendency is exhibited especially by the elements of the 4th, 5th, 6th and 7th groups and is known as Abegg's rule.

Absolute humidity.—See *Humidity*

Absolute pressure.—See *Pressure*

Absolute temperature.—Temperature reckoned from the absolute zero. See *Temperature*

Absolute units.—A system of units based on the smallest possible number of independent units. Specifically, units of force, work, energy and power not derived from or dependent on gravitation.

Absolute zero.—The temperature at which a gas would show no pressure if the general law for gases would hold for all temperatures. It is equal to $-273.16°$C or $-459.69°$F.

Absorption.—1. Penetration of a substance into the body of another. 2. Transformation into other forms suffered by radiant energy passing through a material substance.

Absorption coefficient.—See *Absorption factor*

Absorption factor.—The ratio of the intensity loss by absorption to the total original intensity of radiation. If I_o represents the original intensity, I_r, the intensity of reflected radiation, I_t, the intensity of the transmitted radiation, the absorption factor is given by the expression

$$\frac{I_o - (I_r + I_t)}{I_o}$$

Also called coefficient of absorption.

Permission was granted by D. Van Nostrand Company, Inc. publishers of The Dictionary of Physics and Electronics for the inclusion of 18 definitions in this section.

Absorption, Lambert's law.—If I_o is the original intensity, I the intensity after passing through a thickness x of a material whose absorption coefficient is k,

$$I = I_o e^{-kx}$$

The **index of absorption** k' is given by the relation $k = (4\pi k'n)/\lambda$ where n is the index of refraction and λ the wave length in vacuo. The **mass absorption** is given by k/d when d is the density. The transmission factor is given by I/I_o.

Absorption spectrum.—The spectrum obtained by the examination of light from a source, itself giving a continuous spectrum, after this light has passed through an absorbing medium in the gaseous state. The absorption spectrum will consist of dark lines or bands, being the reverse of the emission spectrum of the absorbing substance.

When the absorbing medium is in the solid or liquid state the spectrum of the transmitted light shows broad dark regions which are not resolvable into lines and have no sharp or distinct edges.

Absorptive power or absorptivity for any body is measured by the fraction of the radiant energy falling upon the body which is absorbed or transformed into heat. This ratio varies with the character of the surface and the wave length of the incident energy. It is the ratio of the radiation absorbed by any substance to that absorbed under the same conditions by a black body.

Abvolt.—The cgs electromagnetic unit of potential difference and electromotive force. It is the potential difference that must exist between two points in order that one erg of work be done when one abcoulomb of charge is moved from one point to the other. One abvolt is 10^{-8} volt.

Acceleration.—The time rate of change of velocity in either speed or direction. Cgs unit,—one centimeter per second per second. Dimensions,—$[l\ t^{-2}]$.—See *Angular acceleration*

Acceleration due to gravity.—The acceleration of a body freely falling in a vacuum. The International Committee on Weights and Measures has adopted as a standard or accepted value, 980.665 cm/sec² or 32.174 ft/sec².

Acceleration due to gravity at any latitude and elevation.—If ϕ is the latitude and H the elevation in centimeters the acceleration in cgs units is, $g = 980.616 - 2.5928 \cos 2\phi + 0.0069 \cos^2 2\phi - 3.086 \times 10^{-6} H$. (Helmert's equation)

Accelerators.—Machines for speeding up subatomic particles to energies running into millions of electron volts.—See *Betatron, cyclotron*, etc.

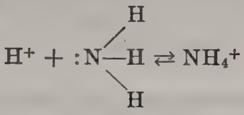
Achromatic.—A term applied to lenses signifying their more or less complete correction for chromatic aberration.

Acid.—For many purposes it is sufficient to say that an acid is a hydrogen-containing substance which dissociates on solution in water to produce one or more hydrogen ions. More generally, however, acids are defined according to other concepts. The Brönsted concept states that an acid is any compound which can furnish a proton. Thus NH_4^+ is an acid since it can give up a proton:

$$NH_4^+ \rightleftarrows NH_3 + H^+$$

and NH_3 is a base since it accepts a proton.

A still more general concept is that of G. N. Lewis which defines an acid as anything which can attach itself to something with an unshared pair of electrons. Thus in the reaction



the NH_3 is a base because it possesses an unshared pair of electrons. This latter concept explains many phenomena, such as the effect of certain substances other than hydrogen ions in the changing of the color of indicators. It also explains acids and bases in non-aqueous sytems as liquid NH_3 and SO_2.

Actinide Series.—Elements of atomic numbers 89 to 103 analogous to the lanthanide series of the so-called rare earths.

Action is measured by the product of work by time. Cgs units of action are the erg-second and the joule-second. Dimensions,—$[m\ l^2\ t^{-1}]$. Planck's quantum or constant of action is 6.554×10^{-27} erg-seconds.

Active mass of a substance is the number of gram molecular weights per liter in solution, or in gaseous form.

Activity coefficient.—A factor which, when multiplied by the molecular concentration yields the active mass. The activity coefficient is evaluated by thermodynamic calculations, usually from data on the emf of certain cells, or the lowering of the freezing point of certain solutions. It is a correction factor which makes the thermodynamic calculations correct.

Adiabatic.—A body is said to undergo an adiabatic change when its condition is altered without gain or loss of heat. The line on the pressure volume diagram representing the above change is called an adiabatic line.

Adsorption.—The condensation of gases, liquids, or dissolved substances on the surfaces of solids is called adsorption.

Air columns, frequency of vibration in—See *Organ pipes*

Allobar.—A form of an element differing in isotopic composition from the naturally occurring form.

Allotropy.—The property shown by certain elements or being capable of existence in more than one form, due to differences in the arrangement of atoms or molecules.—See *Monotropic* and *Enantiotropic*

Alpha (α)-particle, or alpha-ray.—One of the particles emitted in radioactive decay. It is identical with the nucleus of the helium atom and consists, therefore, of two protons plus two neutrons bound together. A moving alpha particle is strongly ionizing and so loses energy rapidly in traversing through matter. Natural alpha particles will traverse only a few centimeters of air before coming to rest.

Alternating current, (A-C).—Current in which the charge-flow periodically reverses, as opposed to direct current, and whose average value is zero. Alternating current usually implies a sinusoidal variation of current and voltage. This behavior is represented mathematically in various ways:

$$\mathrm{I} = I_0 \cos (2\pi ft + \phi)$$
$$\mathrm{I} = I_0 \angle\phi$$
$$\mathrm{I} = I_1 e^{j\omega t}$$

where f is the frequency; $\omega \equiv 2\pi f$, the pulsatance, or radian frequency; ϕ the phase angle; I_0 the amplitude; and I_1 the complex amplitude. In the complex rotation, it is understood that the actual current is the real part of I. For circuits involving also a capacitance C in farads and L in henrys, the impedance becomes,

$$\sqrt{R^2 + \left(2\pi fL - \frac{1}{2\pi fC}\right)^2}$$

Altitudes with the barometer.—If b_1 and b_2 denote the corrected barometer readings at two stations, t the mean of the temperatures, t_1 and t_2 of the air at the two stations, e_1 and e_2 the tension of water vapor at the two stations, h the mean height above sea level, ϕ the latitude; then the difference in elevation in centimeters is $H = 1{,}843{,}000 (\log b_1 - \log b_2) (1 + 0.00367t) (1 + 0.0026 \cos 2\phi + 0.00002h + \frac{3}{8}k)$, where

$$k = \tfrac{1}{2}\left(\frac{e_1}{b_1} + \frac{e_2}{b_2}\right)$$

An approximate formula, sufficient for differences not over 1000 meters is

$$H = 1{,}600{,}000 \frac{b_1 - b_2}{b_1 + b_2} (1 + 0.004t).$$

Amorphous.—Without definite form, not crystallized.

Ampere's rule.—A positive charge moving horizontally is deflected by a force to the right if it is moving in a region where the magnetic field is vertically upward. This may be generalized to currents in wires by recalling that a current in a certain direction is equivalent to the motion of positive charges in that direction. The force felt by a negative charge is opposite to that felt by a positive charge.

Amplitude.—The maximum value of the displacement in an oscillatory motion.

AMU.—The atomic mass unit, a unit of mass equal to one-sixteenth the mass of the atom of oxygen of mass number 16.

$$1 \text{ amu} = 1.657 \times 10^{-24} \text{ grams.}$$

In terms of energy, 1 amu = 931 mev = 1.49×10^{-3} ergs.

Angle.—The ratio between the arc and the radius of the arc. Units of angle,—the radian, the angle subtended by an arc equal to the radius; the degree, $\frac{1}{360}$ part of the total angle about a point. Dimensions,—a numeric.

Angstrom.—A unit of length, used especially in expressing the length of light waves, equal to one ten-thousandth of a micron, or one hundred-millionth of a centimeter (1×10^{-8} cm).

Angular acceleration.—The time rate of change of angular velocity either in angular speed or in direction of the axis of rotation (precession). Cgs unit,—one radian per second per second. Dimensions,—$[t^{-2}]$.

If the initial angular velocity is ω_o, and the velocity after time t is ω_t, the angular acceleration,

$$\alpha = \frac{\omega_t - \omega_o}{t}$$

The angular velocity after time t,

$$\omega_t = \omega_o + \alpha t$$

The angle swept out in time t,

$$\theta = \omega_o t + \tfrac{1}{2}\alpha t^2$$

The angular velocity after movement through the arc θ,

$$\omega = \sqrt{\omega_o{}^2 + 2\alpha\theta}$$

In the above equations, for angular displacement in radians, angular velocity will be in radians per second and angular acceleration in radians per second per second.

Angular aperture of an objective is the largest angular extent of wave surface which it can transmit.

Angular harmonic motion or harmonic motion of rotation.—Periodic, oscillatory angular motion in which the restoring torque is proportional to the angular displacement. Torsional vibration.

Angular momentum or moment of momentum.—Quantity of angular motion measured by the product of the angular velocity and the moment of inertia. Cgs unit,—unnamed, its nature is expressed by g-cm²/sec. Dimensions,—$[m\, l^2\, t^{-1}]$.

The angular momentum of a mass whose moment of inertia is I, rotating with angular velocity ω, is $I\omega$.

Angular velocity.—Time rate of angular motion about an axis. Cgs unit,—one radian per second. Dimensions,—$[t^{-1}]$.

If the angle described in time t is θ, the angular velocity,

$$\omega = \frac{\theta}{t}$$

θ in radians and t in seconds gives ω in radians per second.

Anhydride (of acid or base).—An oxide which when combined with water gives an acid or base.

Anion.—A negatively charged ion.

Anode.—The electrode at which oxidation occurs in a cell. It is also the electrode toward which anions travel due to the electrical potential. In spontaneous cells the anode is considered negative. In non-spontaneous or electrolytic cells the anode is considered positive.

Apochromat.—A term applied to photographic and microscope objectives indicating the highest degree of color correction.

Archimedes principle.—A body wholly or partly immersed in a fluid is buoyed up by a force equal to the weight of the fluid displaced. A body of volume V cm^3 immersed in a fluid of density ρ grams per cm^3 is buoyed up by a force in dynes,

$$F = \rho g V$$

where g is the accleration due to gravity.

A floating body displaces its own weight of liquid.

Area, unit of.—The square centimeter. The area of a square whose sides are one centimeter in length. Other units of area are similarly derived. Dimensions,—$[l^2]$.

Arrhenius theory of electrolytic dissociation states that the molecule of an electrolyte can give rise to two or more electrically charged atoms or ions.

Astigmatism is an error of spherical lenses peculiar to the formation of images by oblique pencils. The image of a point when astigmatism is present will consist of two focal lines at right angles to each other and separated by a measurable distance along the axis of the pencil. The error is not eliminated by reduction of aperture as is spherical aberration.

Atom.—The smallest particle of an element which can enter into a chemical *combination*. All chemical compounds are formed of atoms, the difference between compounds being attributable to the nature, number, and arrangement of their constituent atoms.—See *isotopes, nuclear atom*

Atomic bomb.—An explosive that derives its energy from the fission of atomic nuclei.

Atomic energy.—1. The constitutive internal energy of the atom which was absorbed when it was formed. 2. Energy derived from the mass converted into energy in nuclear transformations.—See *Einstein's formula*

Atomic mass (**atomic weight**).—The mass of a neutral atom of a nuclide. It is usually expressed in terms of the physical scale of atomic masses, that is, in atomic mass units (amu). See AMU

Atomic number.—The number (Z) of protons within the atomic nucleus. The electrical charge of these protons determines the number and arrangement of the outer electrons of the atom, and thereby the chemical and physical properties of the element.

Atomic structure.—According to the currently accepted view, the atom consists of a central part, called nucleus, and a number of *electrons* (called orbital or planetary electrons) circling about the latter, like planets about the sun. The nucleus is of a high specific weight; it contains most of the mass of the entire atom (its mass is considered equal to the atomic mass) and is composed of positively charged particles, called *protons* (the number of which always equals the atomic number, (Z), and particles of 0 charge, called neutrons (the number of which equals the difference between the atomic weight and the atomic number, $A - Z$). The diameter of the nucleus is between 10^{-13} and 10^{-12} cm, and the relatively vast distance in which the orbital electrons circle about it is illustrated by the fact that this nuclear diameter is only 10^{-4} to 10^{-5} of the entire atomic diameter. While the nucleus carries an integral number of positive charges (an integral number of protons) each of $1{\cdot}6 \times 10^{-19}$ coulomb, each electron carries one negative charge of $1{\cdot}6 \times 10^{-19}$ coulomb, and the number of orbital electrons is equal to the number of protons in the nucleus (i.e. to the atomic number, Z), so that the atom as a whole has a net charge of 0. The electrons are arranged in successive shells (q.v.) around the nucleus; the maximum number of electrons in each shell is determined by natural laws, and the extranuclear electronic structure of the atom is characteristic of the element. The electrons in the inner shells are tightly bound to the nucleus; this inner structure can be altered by high-energy particles, γ-rays of radium, or x-rays. The electrons in the outer shells are responsible for the chemical properties of the element.—See *Bohr's atomic theory*, *Heisenberg's theory*, *shell and subshell*

Atomic theory.—All elementary forms of matter are composed of very small unit quantities called atoms. The atoms of a given element all have the same size and weight. The atoms of different elements have different sizes and weights. Atoms of the same or different elements unite with each other to form very small unit quantities of compound substances called molecules.

Atomic weight.—Atomic weight is the relative weight of the atom on the basis of oxygen as 16. For a pure isotope, the atomic weight rounded off to the nearest integer gives the total number of nucleons (neutrons and protons) making up the atomic nucleus. If these weights are expressed in grams they are called gram atomic weights.—See *Isotopes and Atomic Mass*

Avogadro's law.—Equal volumes of different gases at the same pressure and temperature contain the same number of molecules.

Avogadro's number.—The number of molecules in one mole or gram-molecular weight of a substance. A number of values of the Avogadro number, which is usually denoted by N, have been found by various methods, generally lying within a range of 1% about the value 6.02×10^{23}.

Avogadro's principle (or theory).—The numbers of molecules present in equal volumes of gases at the same temperature and pressure are equal.

Babo's law.—The addition of a non-volatile solid to a liquid in which it is soluble lowers the vapor pressure of the solvent in proportion to the amount of substance dissolved.

Balmer series of spectral lines. The wave lengths of a series of lines in the spectrum of hydrogen are given in angstroms by the equation

$$\lambda = 3646 \frac{N^2}{N^2 - 4}$$

where N is an integer having values greater than 2.

Bar.—International unit of pressure 10^6 dyne/cm². Unfortunately some writers have used this term for 1 dyne/cm². 1 bar = 0.987 atmosphere.

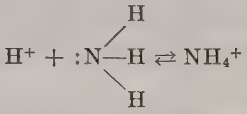
Barn.—Unit for measuring capture cross sections (q.v.) of elements. One barn = 10^{-24} cm² per nucleus.

Barye.—Cgs pressure unit = one dyne/cm².

Bases.—For many purposes it is sufficient to say that a base is a substance which dissociates on solution in water to produce one or more hydroxyl ions. More generally, however, bases are defined according to other concepts. The Brönsted concept states that a base is any compound which can accept a proton. Thus NH_3 is a base since it can accept a proton to form ammonium ions.

$$NH_3 + H^+ \rightleftarrows NH_4^+$$

A still more general concept is that of G. N. Lewis which defines a base as anything which has an unshared pair of electrons. Thus in the reaction



$$H^+ + :\overset{H}{\underset{H}{N}}-H \rightleftarrows NH_4^+$$

the NH_3 is a base because it possesses an unshared pair of electrons. This latter concept explains many phenomena, such as the effect of certain substances other than hydrogen ions in the changing of the color of indicators. It also explains acids and bases in non-aqueous systems as liquid NH_3 and SO_2.

Beat(s).—Two vibrations of slightly different frequencies f_1 and f_2 when added together, produce in a detector sensitive to both these frequencies, a regularly varying response which rises and falls at the "beat" frequency $f_b = |f_1 - f_2|$. It is important to note that a resonator which is sharply tuned to f_b alone will not resound at all in the presence of these two beating frequencies.—See *Combination Frequencies*

Beat frequencies.—The beat of two different frequencies of signals on a non-linear circuit when they combine or beat together. It has a frequency equal to the difference of the two applied frequencies.

Beer's law.—If two solutions of the same colored compound be made in the same solvent, one of which is, say, twice the concentration of the other, the absorption due to a given thickness of the first solution should be equal to that of twice the thickness of the second.

Mathematically this may be expressed $l_1c_1 = l_2c_2$ when the intensity of light passing through the two solutions is a constant and if the intensity and wave length of light incident upon each solution are the same.

Bernoulli's theorem.—At any point in a tube through which a liquid is flowing the sum of the pressure energy, potential energy, and kinetic energy is constant. If p is pressure; h, height above a reference plane; d, density of the liquid, and v, velocity of flow,

$$p + hdg + \tfrac{1}{2}\, dv^2 = \text{a constant.}$$

Berthelot principle of maximum work.—Of all possible chemical processes which can proceed without the aid of external energy, that process always takes place which is accompanied by the greatest evolution of heat. This law holds good for low temperatures only and does not account for endothermic reactions.

Beta (β)**-particle, (Beta ray).**—One of the particles which can be emitted by a radioactive atomic nucleus. It has a mass about $\frac{1}{1837}$ that of the proton. The negatively charged beta particle is identical with the ordinary electron, while the positively charged type (positron) differs from the electron in having equal but opposite electrical properties. The emission of an electron entails the change of a neutron into a proton inside the nucleus. The emission of a positron is similarly associated with the change of a proton into a neutron. Beta particles have no independent existance inside the nucleus, but are created at the instant of emission.—See *Neutrino*

Betatron.—An accelerator used to impart high velocities to electrons (beta particles). Propellant is an electromagnetic field. A five to six Mev betatron can produce X-rays equivalent to the gamma readiation of 10 to 20 grams of radium.

Bevatron.—A six or more billion electron volt accelerator of protons and other atomic particles. Makes use of a Cockcroft-Walton transformer cascade accelerator and a linear (q.v.) as well as an electromagnetic field in the build-up.

Black body.—If, for all values of the wave length of the incident radiant energy, all of the energy is absorbed the body is called a black body.

Bohr's atomic theory.—The theory that atoms can exist for a duration solely in certain states, characterized by definite electronic orbits, i.e. by definite energy levels of their extranuclear electrons, and in these stationary states they do not emit radiation; the jump of an electron from an orbit to another of a smaller radius is accompanied by monochromatic radiation.

Boyle's law for gases.—At a constant temperature the volume of a given quantity of any gas varies inversely as the pressure to which the gas is subjected. For a perfect gas, changing from pressure p and volume v to pressure p' and volume v' without change of temperature,

$$pv = p'v'$$

Breeder, Reactor (Breeder pile).—A nuclear chain reactor in which transmutation produces a greater number of fissionable atoms than the number of parent atoms consumed.

Brewster's law.—The tangent of the polarizing angle for a substance is equal to the index of refraction. The polarizing angle is that angle of incidence for which the reflected polarized ray is at right angles to the refracted ray. If n is the index of refraction and θ the polarizing angle, $n = \tan \theta$.

Brightness is measured by the flux emitted per unit emissive area as projected on a plane normal to the line of sight. The unit of brightness is that of a perfectly diffusing surface giving out one lumen per square centimeter of projected surface and is called the lambert. The millilambert (0.001 lambert) is a more convenient unit. **Candle per square centimeter** is the brightness of a surface which has, in the direction considered, a luminous intensity of one candle per cm^2.

British thermal unit.—The quantity of heat required to raise the temperature of one pound of water one degree Fahrenheit at, or near, its point of maximum density (39.1°F). The btu is eqivalent to 0.252 kilogram-colorie.

Brownian movement.—A continuous agitation of particles in a colloidal solution caused by unbalanced impacts with molecules of the surrounding medium. The motion may be observed with a microscope when a strong beam of light is caused to traverse the solution across the line of sight.

Bulk modulus.—The modulus of volume elasticity,

$$M_B = \frac{p_2 - p_1}{\dfrac{v_1 - v_2}{v_1}}$$

where p_1, p_2; v_1, v_2 are the initial and final pressure and volume respectively.

Calorie.—The amount of heat necessary to raise 1 gram of water at 15°C, 1°C.

Calutron.—An apparatus operating on the principle of the mass spectrograph and used for separating U^{235} from U^{238}.

Candle (or International Candle).—The candle is the unit of luminous intensity. It is a specified fraction of the average horizontal candlepower of a group of 45 carbon-filament lamps preserved at the Bureau of Standards.

Candle (new unit).—$\frac{1}{60}$ of the intensity of one square centimeter of a blackbody radiator at the temperature of solidification of platinum (2,046°K).

Capacitance is measured by the charge which must be communicated to a body to raise its potential one unit. Electrostatic unit capacitance is that which requires one electrostatic unit of charge to raise the potential one electrostatic unit. The farad = 9×10^{11} electrostatic units. A capacitance of one farad requires one coulomb of electricity to raise its potential one volt. Dimensions,—$[\epsilon\, l]$; $[\mu^{-1}\, l^{-1}\, t^2]$.

A conductor charged with a quantity Q to a potential V has a capacitance,

$$C = \frac{Q}{V}$$

Capacitance of a spherical conductor of radius r,

$$C = Kr$$

Capacitance of two concentric spheres of radii r and r'

$$C = K\frac{rr'}{r - r'}$$

Capacitance of a parallel plate condenser, the area of whose plates is A and the distance between them d,

$$C = \frac{KA}{4\pi d}$$

Capacitances will be given in electrostatic units if the dimensions of condensers are substituted in cm. K is the dielectric constant of the medium.

Capillary constant or specific cohesion,

$$a^2 = \frac{2T}{(d_1 - d_2)g} = hr$$

where T is surface tension, d_1 and d_2, the densities of the two fluids, g the acceleration due to gravity, h the height of rise in a capillary tube of radius r.—See *Surface tension*

Carnot cycle.—A sequence of operations forming the working cycle of an ideal heat engine of maximum thermal efficiency. It consists of isothermal expansion, adiabatic expansion, isothermal compression, and adiabatic compression to the initial state.

Catalytic agent.—A substance which by its mere presence alters the velocity of a reaction, and may be recovered unaltered in nature or amount at the end of the reaction.

Cathode.—The electrode at which reduction occurs. It is the negative electrode in a cell through which current is being forced, but it is the positive pole of a battery. In a vacuum tube, the cathode is the electrode from which electrons are liberated.—See *Anode*

Cation.—A positively charged ion.

Cauchy's dispersion formula.

$$n = A + \frac{B}{\lambda^2} + \frac{C}{\lambda^4} + \cdots$$

An empirical expression giving an approximate relation between the refractive index n of a medium and the wavelength λ of the light; A, B, and C being constants for a given medium.

Centipoise.—A standard unit of *viscosity*, equal to 0.01 poise, the c.g.s. unit of viscosity. Water at 20°C has a viscosity of 1.002.

Centripetal force.—The force required to keep a moving mass in a circular path. Centrifugal force is the name given to the reaction against centripetal force.

Chain Reaction.—In general, any self-sustaining process, whether molecular or nuclear, the products of which are instrumental in, and directly contribute to the propagation of the process. Specifically, a *fission chain reaction*, where the energy liberated or particles produced (fission products) by the fission of an atom cause the fission of other atomic nuclei, which in turn propagate the fission reaction in the same manner.

Charles' law or Gay-Lussac's law.—The volumes assumed by a given mass of a gas at different temperatures, the pressure remaining constant, are, within moderate ranges of temperature, directly proportional to the corresponding absolute temperatures.

Chemiluminescence.—Emission of light during a chemical reaction.

Christiansen effect.—When finely powdered substances, such as glass or quartz, are immersed in a liquid of the same index of refraction complete transparency can only be obtained for monochromatic light. If white light is employed the transmitted color corresponds to the particular wave-length for which the two substances, solid and liquid have exactly the same index of refraction. Due to differences in dispersion the indices of refraction will match for only a narrow band of the spectrum.

Chromatic aberration.—Due to the difference in the index of refraction for different wave lengths, light of various wave lengths from the same source cannot be focused at a point by a simple lens. This is called chromatic aberration.

Cloud chamber.—An apparatus containing moist air or other gas which on sudden expansion condenses moisture to droplets on dust particles or other nuclei. Thus charged particles or ions in the space become nuclei and their numbers and behavior, when properly illuminated, may be studied.

Colligative property.—A property numerically the same for a group of substances, independent of their chemical nature.

Colloid.—A phase dispersed to such a degree that the surface forces become an important factor in determining its properties.

In general particles of colloidal dimensions are approximately 10 angstroms to 1 micron in size. Colloidal particles are often best distinguished from ordinary molecules due to the fact that colloidal particles cannot diffuse through membranes which do allow ordinary molecules and ions to pass freely.

Coma.—An aberration of spherical lenses, occurring in the case of oblique incidence, when the bundle of rays forming the image is unsymmetrical. The image of a point is comet shaped, hence the name.

Combination frequencies.—Two vibrations of arbitrary frequencies f_1 and f_2 when applied simultaneously to a nonlinear (distorting) device will excite it to a motion containing not only the original frequencies, but also members of a set of "combination" frequencies given by $f_c = mf_1 + nf_2$ where m and n are integers. A resonator sharply tuned to any one of these frequencies which may be produced in the nonlinear device will resound to it with an amplitude depending on the type of nonlinearity. The superheterodyne radio receiver depends on this phenomenon.

Combining volumes.—Under comparable conditions of pressure and temperature the volume ratios of gases involved in chemical reactions are simple whole numbers.

Combining weight of an element or radical is its atomic weight divided by its valence.

Combining weights, law of.—If the weights of elements which combine with each other be called their "combining weights," then elements always combine either in the ratio of their combining weights or of simple multiples of these weights.

Component substances, law of.—Every material consists of one substance, or is a mixture of two or more substances, each of which exhibits a specific set of properties, independent of the other substances.

Compounds are substances containing more than one constituent element and having properties, on the whole, different from those which their constituents had as elementary substances. The composition of a given pure compound is perfectly definite, and is always the same no matter how that compound may have been formed.

Compressibility.—Reciprocal of the bulk modulus.

Compton effect, (Compton recoil effect).—Elastic scattering of photons by electrons results in decrease in frequency and increase of wave length of x-rays and gamma-rays when scattered by free electrons.

Concentration.—The amount of a substance in weight, moles, or equivalents contained in unit volume.

Condensers in parallel and series.—If c_1, c_2, c_3, etc. represent the capacitances of a series of condensers and C their combined capacitance,—

when in parallel, $C = c_1 + c_2 + c_3 \cdots$

when in series, $\frac{1}{C} = \frac{1}{c_1} + \frac{1}{c_2} + \frac{1}{c_3} \cdots$

Conductance, the reciprocal of resistance, is measured by the ratio of the current flowing through a conductor to the difference of potential between its ends. The practical unit of conductance, the mho, the conductance of a body through which one ampere of current flows when the potential difference is one volt. The conductance of a body in mho is the reciprocal of the value of its resistance in ohms. Dimensions,—$[\epsilon\, l\, t^{-1}]\cdot[\mu^{-1}\, l^{-1}\, t]$.

Conductivity, electrical, is measured by the quantity of electricity transferred across unit area, per unit potential gradient per unit time. Reciprocal of resistivity. **Volume conductivity** or specific conductance, $k = 1/\rho$ where ρ is the volume resistivity. **Mass conductivity** $= k/d$ where d is density. **Equivalent conductivity** $\Lambda = k/c$ where c is the number of equivalents per unit volume of solution. **Molecular conductivity** $\mu = k/m$ where m is the number of moles per unit volume of solution. Dimensions: volume conductivity,—$[\epsilon\, t^{-1}]$; $[\mu^{-1}\, l^{-2}\, t]$,—mass conductivity,—$[\epsilon\, m^{-1}\, l^3\, t^{-1}]$; $[\mu^{-1}\, m^{-1}\, lt]$.

Conductivity, thermal.—Time rate of transfer of heat by conduction, through unit thickness, across unit area for unit difference of temperature. It is measured as calories per second per square centimeter for a thickness of one centimeter and a difference of temperature of 1°C. Dimensions,—$[m\, l\, t^{-3}\, \theta^{-1}]$.

If the two opposite faces of a rectangular solid are maintained at temperatures t_1 and t_2 the heat conducted across the solid of section a and thickness d in a time T will be,

$$Q = \frac{K(t_2 - t_1)aT}{d}$$

K is a constant depending on the nature of the substance, designated as the specific heat conductivity. K is usually given for Q in calories, t_1 and t_2 in °C, a in cm², T in sec, and d in cm.—See *Heat conductivity*

Conductors.—A class of bodies which are incapable of supporting electric strain. A charge given to a conductor spreads to all parts of the body.

Conjugate foci.—Under proper conditions light divergent from a point on or near the axis of a lens or spherical mirror is focused at another point. The point of convergence and the position of the source are interchangeable and are called conjugate foci.

Conservation of energy, (Chem).—In a chemical change there is no loss or gain but merely a transformation of energy from one form to another.

Conservation of energy, law of.—Energy can neither be created nor destroyed and therefore the total amount of energy in the universe remains constant.

Conservation of mass.—In all ordinary chemical changes, the total of the reactants is always equal to the total mass of the products.

Conservation of momentum, law of.—For any collision, the vector sum of the momenta of the colliding bodies after collision equals the vector sum of their momenta before collision. If two bodies of masses m_1 and m_2 have, before impact velocities v_1 and v_2 and after impact velocities u_1 and u_2.

$$m_1u_1 + m_2u_2 = m_1v_1 + m_2v_2$$

Constitutive property.—A property which depends on the constitution or structure of the molecule.

Cooling.—Processing highly radioactive materials to attain lesser radioactivity for subsequent use or handling.

Cosmic rays.—Highly penetrating radiations which strike the earth, assumed to originate in interstellar space. They are classed as: primary, coming from the assumed source, and secondary, those induced in upper atmospheric nuclei by collisions with primary cosmic rays.

Cosmotron.—A particle accelerator capable of giving them energies to billions of electron volts.

Coulomb.—A unit quantity of electricity. It is the quantity of electricity which must pass through a circuit to deposit 0.0011180 grams of silver from a solution of silver nitrate. An ampere is one coulomb per second. A coulomb is also the quantity of electricity on the positive plate of a condenser of one-farad capacity when the electromotive force is one volt.

Couple.—Two equal and oppositely directed parallel but not colinear forces acting upon a body form a couple. The moment of the couple or torque is given by the product of one of the forces by the perpendicular distance between them. Dimension,—$[m\ l^2\ t^{-2}]$.

Couple acting on a magnet of magnetic moment ml in a field of strength H. If the magnet is perpendicular to the direction of the field

$$C = Hml = HM$$

If the angle between the magnet and the field is θ

$$C = Hml \sin \theta$$

The couple will be in dyne-cm for cgs electromagnetic units of H, m and l.

Critical mass.—The minimum mass the fissile material must have in order to maintain a spontaneous fission chain reaction. For pure U^{235} it is computed to be about 20 pounds.

Critical temperature is that temperature above which a gas cannot be liquefied by pressure alone. The pressure under which a substance may exist as a gas in equilibrium with the liquid at the critical temperature is the **critical pressure.**

Cross section, (Nuclear cross section).—A measure of the probability of a particular process. The nuclear cross section is expressed by a/bc, where a is the number of processes occurring, b the number of incident particles, and c the number of target nuclei per cm^2. There are nuclear cross sections for fission, for slow neutron capture, for Compton collision, and for ionization by electron impact.

Cryohydrate.—The solid which separates when a saturated solution freezes. It contains the solvent and the solute in the same proportions as they were in the saturated solution.

Crystal.—A homogeneous portion of a substance bounded by plane surfaces making definite angles with each other, giving a regular geometrical form.

Curie.—Unit for measuring radioactivity. One Curie = that quantity of any radioactive isotope undergoing 3.7×10^{10} disintegrations per second.

Curie's law.—The intensity of magnetization,

$$I = \frac{AH}{T}$$

where H, is the magnetic field strength, T the absolute temperature and A Curie's constant. Used for paramagnetic substances.

Curie point.—All ferro-magnetic substances have a definite temperature of transition at which the phenomena of ferromagnetism disappear and the substances become merely paramagnetic. This temperature is called the "Curie Point" and is usually lower than the melting point.

Curie-Weiss law.—The Curie law was modified by Weiss to state that the susceptibility of a paramagnetic substance above the Curie point varies inversely as the excess of the temperature above that point.

This law is not valid at or below the Curie point.

Current (electric).—The rate of transfer of electricity. The transfer at the rate of one electrostatic unit of electricity in one second is the electrostatic unit of current. The electromagnetic unit of current is a current of such strength that one centimeter of the wire in which it flows is pushed sideways with a force of one dyne when the wire is at right angles to a magnetic field of unit intensity. The practical unit of current is the **ampere,** a transfer of one coulomb per second, which is one tenth the electromagnetic unit. The **international ampere** is the unvarying electric current which, when passed through a solution of silver nitrate in accordance with certain specifications, deposits silver at the rate of 0.00111800 gram per second. The international ampere is equivalent to 0.999835 absolute ampere. The **ampere-turn** is the magnetic potential produced between the two faces of a coil of one turn carrying one ampere. Dimensions,—$[\epsilon^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{3}{2}}\ t^{-2}]$; $[\mu^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}\ t^{-1}]$.

Current in a simple circuit.—The current in a circuit including an external resistance R and a cell of electromotive force E and internal resistance r,

$$I = \frac{E}{R + r}$$

If E is in volts and r and R in ohms the current will be in amperes.

For two cells in parallel,

$$I = \frac{E}{R + \frac{r}{2}}$$

For two cells in series,

$$I = \frac{2E}{R + 2r}$$

Cyclotron.—The magnetic resonance accelerator for imparting very great velocities to heavier nuclear particles without the use of excessive voltages.

Dalton's law of partial pressures.—The pressure exerted by a mixture of gases is equal to the sum of the separate pressures which each gas would exert if it alone occupied the whole volume. This fact is expressed in the following formula:

$$PV = V(p_1 + p_2 + p_3, \text{etc.})$$

Decay.—Diminution of a radioactive substance due to nuclear emission of alpha or beta particles, gamma rays or positrons.

Declination.—The angle between the vertical plane containing the direction of the earth's field at any point and a plane containing the geographic north and south meridian.

Decomposition is the chemical separation of a substance into two or more substances, which may differ from each other and from the original substances.

Definite proportions, law of.—In every sample of each compound substance the proportions by weight of the constituent elements are always the same.

Degree of freedom.—The number of the variables determining the state of a system (usually pressure, temperature, and concentrations of the components) to which arbitrary values can be assigned.

Density.—Concentration of matter, measured by the mass per unit volume. Dimensions,—$[m\ l^{-3}]$.

Deuteron.—Nucleus of the deuterium atom or the ion of deuterium. Its structure—one neutron and one proton.

Dew point.—The temperature at which condensation of water vapor in the air takes place.

Diamagnetic materials.—Are those within which an externally applied magnetic field is slightly reduced because of an alteration of the atomic electron orbits produced by the field. Diamagnetism is an atomic-scale consequence of the Lenz law of induction. The permeability of diamagnetic materials is slightly less than that of empty space.

Dielectric constant of a medium is defined by ϵ in the equation

$$F = \frac{QQ'}{\epsilon r^2}$$

where F is the force of attraction between two charges Q and Q' separated by a distance r in a uniform medium.

Dielectrics or insulators or non-conductors.—A class of bodies supporting an electric strain. A charge on one part of a non-conductor is not communicated to any other part.

Diffraction.—That phenomena produced by the spreading of waves around and past obstacles which are comparable in size to their wavelength.

Diffraction grating.—If s is the distance between the rulings, d the angle of diffraction, then the wave length where the angle of incidence is 90° is (for the nth order spectrum),

$$\lambda = \frac{s \sin d}{n}$$

If i is the angle of incidence, d the angle of diffraction, s the distance between the rulings, n the order of the spectrum, the wave length is, $\lambda = \frac{s}{n} (\sin i + \sin d)$.

Diffusion.—If the concentration (mass of solid per unit volume of solution) at one surface of a layer of liquid is d_1 and at the other surface d_2, the thickness of the layer h and the area under consideration A, then the mass of the substance which diffuses through the cross-section A in time t is,

$$m = \Delta A \frac{(d_2 - d_1)t}{h}$$

where Δ is the coefficient of diffusion.

Diffusivity or coefficient of diffusion is also given by Δ in the equation

$$\frac{dQ}{dt} = -\Delta \left(\frac{dc}{dx}\right) dy\, dz$$

where dQ is the amount passing through an area $dy\, dz$ in the direction of x in a time dt where dc/dx is the rate of increase of volume concentration in the direction of x. Dimensions,—$[l^2\, t^{-1}]$.

Diffusivity of heat is given by Δ in the equation

$$\frac{dH}{dt} = -\Delta s d \frac{dT}{dx}\, dy\, dz$$

where dH is the quantity of heat passing through the area $dy\,dz$ in the direction of x in a time dt. The rate of variation of temperature along x is given by dT/dx, s is specific heat and d, density. Dimensions,—$[l^2\,t^{-1}]$.

Dimensional formulae.—If mass, length, and time are considered fundamental quantities, the relation of other physical quantities and their units to these three may be expressed by a formula involving the symbols l, m and t respectively, with appropriate exponents. For example; the dimensional formula for volume would be expressed,—$[l^3]$; velocity,—$[lt^{-1}]$; force—$[m\,lt^{-2}]$. Other fundamental quantities used in dimensional formulae may be indicated as follows: θ, temperature, ϵ the dielectric constant of a vacuum; μ, the magnetic permeability of a vacuum.

Diminution of pressure at the side of a moving stream. If a fluid of density d moves with a velocity v, the diminution of pressure due to the motion is (neglecting viscosity),

$$p = \tfrac{1}{2}\,dv^2$$

Dip.—The angle measured in a vertical plane between the direction of the earth's magnetic field and the horizontal.

Dipole.—(1) A combination of two electrically or magnetically charged particles of opposite sign which are separated by a very small distance. (2) Any system of charges, such as a circulating current, which has the properties that: (a) no forces act on it in a uniform field; (b) a torque proportional to $\sin\,\theta$, where θ is the angle between the dipole axis and a uniform field, does act on it; (c) it produces a potential which is proportional to the inverse square of the distance from it.

Dipole moment.—A mathematical entity; the product of one of the charges of a dipole unit by the distance separating the two dipolar charges. In terms of the definition of a dipole (2), the dipole moment $\mathbf{p}$ is related to the torque $\mathbf{T}$, and the field strength $\mathbf{E}$ (or $\mathbf{B}$) through the equation:

$$\mathbf{T} = \mathbf{p} \times \mathbf{E}.$$

Dipole moment, molecular.—It is found from measurements of dielectric constant (i.e. by its temperature dependence, as in the **Debye equation for total polarization**) that certain molecules have permanent dipole moments. These moments are associated with transfer of charge within the molecule, and provide valuable information as to the molecular structure.

Dispersion.—The difference between the index of refraction of any substance for any two wave lengths is a measure of the dispersion for these wave lengths, called the coefficient of dispersion.

Dispersion forces.—The force of attraction between molecules possessing no permanent **dipole.** The interaction energy is given by

$$U_D = -\frac{3}{4}\,h\,\frac{V_0\alpha^2}{r^6}$$

where h is Planck's constant, V_0 a characteristic frequency of the molecule, r the distance between the molecules, and α the polarizability.

Dispersive power. If n_1 and n_2 are the indices of refraction for wave lengths λ_1 and λ_2 and n the mean index or that for sodium light, the dispersive power for the specified wave length is,

$$\omega = \frac{n_2 - n_1}{n - 1}$$

Displacement is a reaction in which an elementary substance displaces and sets free a constituent element from a compound.

Displacement or elongation at any instant. The distance of a vibrating or oscillating particle from its position of equilibrium.

Distribution law.—A substance distributes itself between two immiscible solvents so that the ratio of its concentrations in the two solvents is approximately a constant (and equal to the ratio of the solubilities of the substance in each solvent). The above statement requires modification if more than one molecular species is formed.

Doppler effect, (Light).—The apparent change in the wave-length of light produced by the motion in the line of sight of either the observer or the source of light.

Doppler effects.—Effects on the apparent frequency of a wave train produced (1) by motion of the source toward or away from the stationary observer, and (2) by motion of the observer toward or from the stationary source; the motion in each case being with reference to the (supposedly stationary) medium.

For sound waves, the observed frequency f_0, in cycles/sec., is given by

$$\mathrm{f}_0 = \frac{v + w - v_0}{v + w - v_s} f_s$$

where v is the velocity of sound in the medium, v_0 is the velocity of the observer, v_s is the velocity of the source, w is the velocity of the wind in the direction of sound propagation, and f_s is the frequency of source.

For optical waves

$$f_0 = f_s \sqrt{\frac{c + v_r}{c - v_r}}$$

where v_r is the velocity of the source relative to the observer and c is the speed of light.

Dosimeter.—A gadget worn by those who work about radioactive sources to record the amount of exposure the wearer has had to radioactivity.

Double decomposition consists of a simple exchange of the parts of two substances to form two new substances.

Dulong and Petit, law of.—The specific heats of the several elements are inversely proportional to their atomic weights. The atomic heats of solid elements are constant and approximately equal to 6.3. Certain elements of low atomic weight and high melting point have, however, much lower atomic heats at ordinary temperatures.

Eddy current.—A current induced in a mass of conducting material by a varying magnetic field. Also called *Foucault current.*

Einstein theory for mass-energy equivalence.—The equivalence of a quantity of mass m and a quantity of energy E by the formula $E = mc^2$. The conversion factor c^2 is the square of the velocity of light.

Elasticity.—The property by virtue of which a body resists and recovers from deformation produced by force.

Elastic limit.—The smallest value of the stress producing permanent alteration.

Elastic moduli.

Young's modulus by stretching.—If an elongation s is produced by the weight of the mass m, in a wire of length l, and radius r, the modulus,

$$M = \frac{mgl}{\pi r^2 s}$$

Young's modulus by bending, bar supported at both ends. If a flexure s is produced by the weight of mass m, added midway between the supports separated by a distance l, for a rectangular bar with vertical dimensions of cross-section a and horizontal dimension b, the modulus is,

$$M = \frac{mgl^3}{4sa^3b}$$

For a cylindrical bar of radius r,

$$M = \frac{mgl^3}{12\pi r^4 s}$$

For a bar supported at one end. In the case of a rectangular bar as described above,

$$M = \frac{4mgl^3}{sa^3b}$$

For a round bar supported at one end,

$$M = \frac{4mgl^3}{3\pi r^4 s}$$

Modulus of rigidity.—If a couple C ($= mgx$) produces a twist of θ radians in a bar of length l and radius r, the modulus is

$$M = \frac{2Cl}{\pi r^4 \theta}$$

The substitution in the above formulae for the elastic coefficients of m in grams, g in cm per sec², l, a, b, and r in cm, s in cm, and C in dyne-cm will give moduli in dynes per cm^2. The dimensions of elastic moduli are the same as of stress,—$[m\, l^{-1}\, t^{-2}]$.

Coefficient of restitution.—Two bodies moving in the same straight line, with velocities v_1 and v_2 respectively, collide and after impact move with velocities v_3 and v_4. The coefficient of restitution is

$$C = \frac{v_4 - v_3}{v_2 - v_1}$$

Electric field intensity is measured by the force exerted on unit charge. Unit field intensity is the field which exerts the force of one dyne on unit positive charge. Dimensions,—$[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{1}{2}}\, t^{-1}]$; $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-2}]$.

The field intensity or force exerted on unit charge at a point distant r from a charge q in a vacuum

$$H = \frac{q}{r^2}$$

If the dielectric in the above cases is not a vacuum the dielectric constant ϵ must be introduced. The formula becomes

$$H = \frac{q}{\epsilon r^2}$$

The value of ϵ is frequently considered unity for air. If the dielectric constant of a vacuum is considered unity the value for air at 0°C and 760 mm pressure is 1.000576.

Electrochemical equivalent of an ion is the mass liberated by the passage of unit quantity of electricity.

Electrolysis.—If a current i flows for a time t and deposits a metal whose electrochemical equivalent is e, the mass deposited is

$$m = eit$$

The value of e is usually given for mass in grams, i in amperes and t in seconds.

Electrolytic dissociation or ionization theory.—When an acid, base or salt is dissolved in water or any other dissociating solvent, a part or all of the molecules of the dissolved substance are broken up into parts called ions, some of which are charged with positive electricity and are called cations, and an equivalent number of which are charged with negative electricity and are called anions.

Electrolytic solution tension theory (or the Helmholtz double layer theory).—When a metal, or any other substance capable of existing in solution as ions, is placed in water or any other dissociating solvent, a part of the metal or other substances passes into solution in the form of ions, thus leaving the remainder of the metal or substances charged with an equivalent amount of electricity of opposite sign from that carried by the ions. This establishes a difference in potential between the metal and the solvent in which it is immersed.

Electromotive force is defined as that which causes a flow of current. The electromotive force of a cell is measured by the maximum difference of potential between its plates. The electromagnetic unit of potential difference is that against which one erg of work is done in the transfer of electromagnetic unit quantity. The **volt** is that potential difference against which one joule of work is done in the transfer of one coulomb. One volt is equivalent to 10^8 electromagnetic units of potential. The **international** volt is the electrical potential which when steadily applied to a conductor whose resistance is one international ohm will cause a current of one international ampere to flow. The international volt = 1.00033 absolute volts. The electromotive force of a Weston standard cell is 1.0183 int. volts at 20°C. Dimensions,—$[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-1}]$, $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{3}{2}}\, t^{-2}]$.

Electromotive series is a list of the metals arranged in the decreasing order of their tendencies to pass into ionic form by losing electrons.

Electron.—The electron is a small particle having a unit negative electrical charge, a small mass, and a small diameter. Its charge is $(4.80223 \pm .00007) \times 10^{-10}$ absolute electrostatic units, its mass $\frac{1}{1837}$ that of the hydrogen nucleus, and its diameter about 10^{-2} cm. Every atom consists of one nucleus and one or more electrons. Cathode rays and Beta rays are electrons.

Electron-volt (ev).—Energy acquired by any charged particle carrying unit electronic charge when it falls through a potential difference of one volt. 1 electron-volt = $(1.60207 \pm .00007 \times 10^{-12}$ erg. Multiples of this unit are also in common use: the kilo-, million-, and billion electron-volt. 1 kev = 10^3 ev; 1 mev = 10^6 ev; and 1 bev = 10^9 ev.

An ev is associated through the Planck constant with a photon of wave length 1.2395 microns.

Elements are substances which cannot be decomposed by the ordinary types of chemical change, or made by chemical union.

Emissive power or emissivity is measured by the energy radiated from unit area of a surface in unit time for unit difference of temperature between the surface in question and surrounding bodies. For the cgs system the emissive power is given in ergs per second per square centimeter with the radiating surface at 1° absolute and the surroundings at absolute zero.—See *Radiation formula*

Enantiotropic.—Crystal forms capable of existing in reversible equilibrium with each other.

Energy.—The capability of doing work. **Potential energy** is energy due to position of one body with respect to another or to the relative parts of the same body. **Kinetic energy** is energy due to motion. Cgs units,—the erg, the energy expended when a force of one dyne acts through a distance of one centimeter; the joule is 1×10^7 ergs. Dimensions,—$[m\,l^2\,t^{-2}]$.

The potential energy of a mass m, raised through a distance h, where g is the acceleration due to gravity is

$$E = mgh.$$

The kinetic energy of mass m, moving with a velocity v, is

$$E = \tfrac{1}{2}mv^2.$$

Energy will be given in ergs if m is in grams, g in cm per sec², h in cm and v in cm per sec.

Energy of a charge in ergs where Q is the charge and V the potential in electrostatic units.

$$E = \tfrac{1}{2}QV.$$

Energy of the electric field.—If H is the electric field intensity in electrostatic units and K the specific inductive capacity, the energy of the field in ergs per cm³ is

$$E = \frac{KH^2}{8\pi}$$

Energy of rotation.—If a mass whose moment of inertia about an axis is I, rotates with angular velocity ω about this axis, the kinetic energy of rotation will be,

$$E = \tfrac{1}{2}I\omega^2$$

Energy will be given in ergs if I is in g-cm² and ω in radians per sec.

Enthalpy, or heat content, is a thermodynamic quantity. It is equal to the sum of the internal energy of a system plus the product of the pressure-volume work done on the system. Thus

$$\mathrm{H} = \mathrm{E} + \mathrm{pv}$$

where H = enthalpy or heat content
E = internal energy of the system
p = pressure
v = volume.

Entropy.—Entropy is the capacity factor for isothermally unavailable energy. The increase in the entropy of a body during an infinitesimal stage of a reversible process is equal to the infinitesimal amount of heat absorbed divided by the absolute temperature of the body. Thus for a reversible process

$$dS = \frac{Q}{T}$$

Every spontaneous process in nature is characterized by an increase in the total entropy of the bodies concerned in the process.

Equilibrium, chemical.—A state of affairs in which a chemical reaction and its reverse reaction are taking place at equal velocities, so that the concentrations of reacting substances remain constant.

Equilibrium constant.—The product of the concentrations (or activities) of the substances produced at equilibrium in a chemical reaction divided by the product of concentrations of the reacting substances, each concentration raised to that power which is the coefficient of the substance in the chemical equation.

Equivalent weight or combining weight of an element or ion is its atomic or formula weight divided by its valence. Elements entering into combination always do so in quantities proportional to their equivalent weights.

In oxidation-reduction reactions the equivalent weight of the reacting substances is dependent upon the change in oxidation number of the particular substance.

Ettinghausen's effect (Von Ettinghausen's).—When an electric current flows across the lines of force of a magnetic field an electromotive force is observed which is at right angles to both the primary current and the magnetic field: a temperature gradient is observed which has the opposite direction to the Hall electromotive force.

Eutectic.—A term applied to the mixture of two or more substances which has the lowest melting point.

Expansion of gases.

Charles' law or Gay-Lussac's law.—The volume of a gas at constant pressure increases proportionately to the absolute temperature. If V_1 and V_2 are volumes of the same mass of gas at absolute temperatures, T_1 and T_2,

$$\frac{V_1}{V_2} = \frac{T}{T_2}$$

For an original volume V_o at 0°C the volume at t°C (at constant pressure) is

$$V_t = V_o(1 + 0.00367t).$$

General law for gases.

$$p_t v_t = p_o v_o \left(1 + \frac{t}{273}\right)$$

where p_o, v_o, p_t, v_t represent the pressure and value at 0° and t°C. or

$$\frac{p_1 v_1}{T_1} = \frac{p_2 v_2}{T_2}$$

where p_1, v_1 and T_1 represent pressure, volume and absolute temperature in one case and p_2, v_2 and T_2 the same quantities for the same mass of gas in another.

The law may also be expressed:

$$pv = RmT$$

where m is the mass of gas at absolute temperature T. R is the **gas constant** which depends on the units used. **Boltzmann's molecular gas constant** is obtained by expressing m in terms of the number of molecules.

For volume in cm^3, pressure in dynes per cm^2 and temperature in Centigrade degrees on the absolute scale $R = 8.3136 \times 10^7$.

Reduction of a gas volume to 0°C, 760 mm pressure.—If V is the original volume of a gas at temperature t and pressure H, the volume at 0°C and 760 mm pressure will be,

$$V_o = \frac{V}{(1 + \alpha t)} \frac{H}{760}$$

If d is the original density the density at 0°C and 760 mm pressure will be

$$d_o = d(1 + \alpha t) \frac{760}{H}$$

$$\alpha = 0.00367 \text{ approximately.}$$

Falling bodies.—For bodies falling from rest conditions are as for uniformly accelerated motion except that $v_o = O$ and g is the acceleration due to gravity. The formulae become,—air resistance neglected,

$$v_t = gt,\ s = \tfrac{1}{2}gt^2,\ v_s = \sqrt{2gs}.$$

For bodies projected vertically upward,—if v is the velocity of projection, the time to reach greatest height, neglecting the resistance of the air,

$$t = \frac{v}{g}$$

Greatest height,

$$h = \frac{v^2}{2g}$$

—See *Projectiles*

Faraday's laws.—In the process of electrolytic changes equal quantities of electricity charge or discharge equivalent quantities of ions at each electrode.

One gram equivalent weight of matter is chemically altered at each electrode for 96,501 int. coulombs, or one faraday, of electricity passed through the electrolyte.

Faraday effect.—The rotation of the plane of polarization produced when plane-polarized light is passed through a substance in a magnetic field, the light traveling in a direction parallel to the lines of force. For a given substance, the rotation is proportional to the thickness traversed by the light and to the magnetic field strength.

Fermat's principle.—The path followed by light (or other waves) passing through any collection of media from one specified point to another, is that path for which the time of travel is least.

Fission.—A nuclear reaction from which the atoms produced are each approximately half the mass of the parent nucleus. In other words, the atom is split into two approximately equal masses. There is also the emission of extremely great quantities of energy since the sum of the masses of the two new atoms is less than the mass of the parent heavy atom. The energy released is expressed by Einstein's equation.

Fleming's rule.—A simple rule for relating the directions of the flux, motion, and e.m.f. in an electric machine. The forefinger, second finger and thumb, placed at right-angles to each other, represent respectively the directions of flux, e.m.f., and motion or torque. If the right hand is used the conditions are those obtaining in a generator and if the left hand is used the conditions are those obtaining in a motor.

Fluidity.—The reciprocal of viscosity. The cgs unit is the rho, the reciprocal of the poise. Dimensions,—$[m^{-1}\,lt]$.

Fluorescence.—The property of emitting radiation as the result of absorption of radiation from some other source. The emitted radiation persists only as long as the exposure is subjected to radiation which may be either electrified particles or waves. The fluorescent radiation generally has a longer wave length than that of the absorbed radiation. If the fluorescent radiation includes waves of the same length as that of the absorbed radiation it is termed resonance radiation.

Foot-candle.—Foot-candle = 1 lumen incident per foot^2 = 1.076 milliphots = 10.76 lux.

Footlambert is the unit of photometric brightness (luminance) equal to $1/\pi$ candle per square foot.

Force.—That which changes the state of rest or motion in matter, measured by the rate of change of momentum. Absolute unit,—the **dyne,** the force which will produce an acceleration of one centimeter per second per second in a gram mass. The gram weight or weight of a gram mass is the cgs gravitational unit. The poundal is that force which will give an acceleration of one foot per second per second to a pound mass. Dimensions,—$[m\,lt^{-2}]$.

The force F required to produce an acceleration a in a mass m is given by

$$F = ma.$$

If m is substituted in grams and a in cm per sec^2, F will be given in dynes.

Force between two charges, Coulomb's law.—If two charges q and q' are at a distance r in a vacuum, the force between them is,

$$F = \frac{qq'}{r^2}$$

The force will be given in dynes if q and q' are in electrostatic units and r in cm.

Force between two magnetic poles.—If two poles of strength m and m' are separated by a distance r in a medium whose permeability is μ (unity for a vacuum), the force between them is,

$$F = \frac{mm'}{\mu r^2}$$

Force will be given in dynes if r is in cm and m and m' are in cgs units of pole strength.

The strength of a magnetic field at a point distance r from an isolated pole of strength m is

$$H = \frac{m}{\mu r^2}$$

The field will be given in gauss if m and r are in cgs units.

Formula, chemical.—A combination of symbols with their subscripts representing the constituents of a substance and their proportions by weight.

Fraunhofer's lines.—When sunlight is examined through a spectroscope it is found that the spectrum is traversed by an enormous number of dark lines parallel to the length of the slit. These dark lines are known as Fraunhofer's lines. Kirchoff conceived the idea that the sun is surrounded by layers of vapors which act as filters of the white light arising from incandescent solids within and which abstract those rays which correspond in their periods of vibration to those of the components of the vapors. Thus reversed or dark lines are obtained due to the absorption by the vapor envelop, in place of the bright lines found in the emission spectrum.

Frequency in uniform circular motion or in any periodic motion is the number of revolutions or cycles completed in unit time. Cgs units,—cycles per second. Dimension,—$[t^{-1}]$.

Frequency of vibrating strings.—The fundamental frequency of a stretched string is given by

$$n = \frac{1}{2l}\sqrt{\frac{T}{m}}$$

where l is the length, T, the tension and m the mass per unit length.

For a string or wire of circular section of length l, tension T, density d, and radius r, the frequency of the fundamental is

$$n = \frac{1}{2rl}\sqrt{\frac{T}{\pi d}}$$

The frequency in vibrations per second will be given if T is in dynes, r and l in cm and d in g per cm^3.

Friction, coefficient of.—The coefficient of friction between two surfaces is the ratio of the force required to move one over the other to the total force pressing the two together.

If F is the force required to move one surface over another and W, the force pressing the surfaces together, the coefficient of friction,

$$k = \frac{F}{W}$$

Fundamental units.—See *Mass, Length and Time*

Fusion (atomic).—A nuclear reaction involving the combination of smaller atomic nuclei or particles into larger ones with the release of energy from mass transformation. This is also called a thermo-nuclear reaction by reason of the extremely high temperature required to initiate it.

Gal.—1 gal = cm/sec./sec. Therefore, where the value of gravity is 980 this is the same as 980 gals. The milligal is now quite commonly used since it is approximately one part in a million of the normal gravity of the earth.

Gamma (γ) rays (nuclear x-rays).—May be emitted from radioactive substances. They are quanta of electromagnetic wave energy similar to but of much higher energy than ordinary x-rays. The energy of a quantum is equal to $h\nu$ ergs, where h is Planck's constant (6.6252×10^{-27} erg sec) and ν is the frequency of the radiation. Gamma rays are highly penetrating, an appreciable fraction being able to traverse several centimeters of lead.

Gas.—A state of matter in which the molecules are practically unrestricted by cohesive forces. A gas has neither definite shape nor volume.

Gas thermometer.—Where P_o, P_s and P_x represent the total pressure with the bulb at 0°C, at the boiling-point of water and at the unknown temperature respectively, t_s the temperature of steam and t_x the unknown temperature,

$$t_x = t_s \frac{P_x - P_o}{P_s - P_o}$$

(approximately). The total pressure on the gas in the bulb is the algebraic sum of barometric pressure at the time and that measured by the manometer.

Gauss.—The cgs emu of magnetic induction (flux density). It is equal to 1 maxwell per cm^2. It has such a value that if a conductor 1 cm long moves through a magnetic field at a velocity of 1 cm, in an induction mutually perpendicular, the induced emf is one abvolt.

Gay-Lussac's law.—See *Charles' law*

Gay-Lussac's law of combining volumes.—If gases interact and form a gaseous product, the volumes of the reacting gases and the volumes of the gaseous products are to each other in simple proportions, which can be expressed by small whole numbers.

Geiger counter.—Detector for radioactivity depending upon ionized particles that affect its mechanism. As its name indicates, it both detects and makes a count of them possible.

Gibbs' phase rule.—$F = C + 2 - P$, F, the number of degrees of freedom of a system, is the number of variable factors (temperature, pressure and concentration) of the components, which must be arbitrarily fixed in order that the condition of the system may be perfectly defined. C, the number of the components of the system, is chosen equal to the smallest number of independently variable constituents by means of which the composition of each phase participating in the state of equilibrium can be expressed in the form of a chemical equation; the components must be chosen from among the constituents which are present when the system is in a state of true equilibrium and which take part in that equilibrium; as components are chosen the smallest number of such constituents necessary to express the composition of each phase participating in the equilibrium, zero and negative quantities of components being permissible; in any system the number of components is definite, but may alter with changes in conditions of experiment; a qualitative but not quantitative freedom of selection of components is allowed, the choice being influenced by suitability and simplicity of application. P, the number of phases of the system, are the homogeneous, mechanically separable and physically distinct portions of a heterogeneous system; the number of phases capable of existence varies greatly in different systems; there can never be more than one gas or vapor phase since all gases are miscible in all proportions, a heterogeneous mixture of solid substances forms as many phases as there are substances present.

Gilbert.—The cgs emu of magnetomotive force. 1 gilbert $= 10/4\pi$ ampere-turns.

Graham's law.—The relative rates of diffusion of gases under the same conditions are inversely proportional to the square roots of the densities of those gases.

Gram atom or gram atomic weight.—The mass in grams numerically equal to the atomic weight.

Gram equivalent of a substance is the weight of a substance displacing or otherwise reacting with 1.008 grams of hydrogen or combining with one-half of a gram atomic weight (8.00 grams) of oxygen.

Gram mole, gram formula weight, gram equivalent.—Mass in grams numerically equal to the molecular weight, formula weight or chemical equivalent, respectively.

Gram molecular weight or gram molecule.—A mass in grams of a substance numerically equal to its molecular weight. Gram mode.

Gravitation.—The universal attraction existing between all material bodies. The force of attraction between two masses m and m', separated by a distance r, k being the constant of gravitation,

$$F = k\frac{mm'}{r^2}$$

(If m and m' are given in grams, and r in centimeters, F will be in dynes if $k = 6.670 \times 10^{-8}$.)

Half-life.—Used to measure the rate of radioactive decay of disintegration. The time lapse during which a radioactive mass loses one half of its radioactivity.

Hall effect.—When a steady current is flowing in a steady magnetic field, electromotive forces are developed which are at right angles both to the magnetic force and to the current and are proportional to the product of the intensity of the current, the magnetic force and the sine of the angle between the directions of these quantities.

Hardness.—Property of substances determined by their ability to abrade or indent one another. An arbitrary scale of hardness is based upon ten selected minerals. For metals the diameter of the indentation made by a hardened steel sphere (Brinnell) or the height of rebound of a small drop hammer (Shore Scleroscope) serve to measure hardness.

Harmonic motion.—See *Simple harmonic motion and Angular harmonic motion*

Heat capacity.—That quantity of heat required to increase the temperature of a system or substance one degree of temperature. It is usually expressed in calories per degree centigrade.

Molar heat capacity is the quantity of heat necessary to raise the temperature of one molecular weight of the substance one degree.

Heat effect.—The heat in calories developed in a circuit by an electric current of I amperes flowing through a resistance of R ohms, with a difference of potential E volts for a time t seconds.

$$H = \frac{RI^2t}{4.18} = \frac{Eit}{4.18}$$

Heat equivalent, or latent heat, of fusion.—The quantity of heat necessary to change one gram of solid to a liquid with no temperature change. Dimensions,—$[l^2\ t^{-2}]$.

Heat of combustion of a substance is the amount of heat evolved by the combustion of 1 gram molecular weight of the substance.

Heat quantity.—The cgs unit of heat is the **calorie,** the quantity of heat necessary to change the temperature of one gram of water from 3.5°C to 4.5°C (called a small calorie). If the temperature change involved is from 14.5 to 15.5°C, the unit is the normal calorie. The mean calorie is $\frac{1}{100}$ the quantity of heat necessary to raise one gram of water from 0°C to 100°C. The large calorie is equal to 1000 small calories. The British thermal unit is the heat required to raise the temperature of one pound of water at its maximum density, 1°F. It is equal to about 252 calories. Dimensions of energy,—$[m\ l^2\ t^{-2}]$.

Hehner number (value).—A number expressing the percentage (i.e. grams per hundred grams) of water-insoluble fatty acids in an oil or fat.

Heisenberg's theory of atomic structure.—The currently accepted view of the structure of atom, formulated by Heisenberg in 1934, according to which the atomic nuclei are built of nucleons, which may be protons or neutrons, while the extranuclear shells consist of electrons only. The nucleons are held together by nuclear forces of attraction, with exchange forces operating between them. The number of protons is equal to the atomic number (Z) of the element, the number of neutrons is equal to the difference between the mass number and the atomic number ($A - Z$). The number of excess neutrons, i.e. the excess of neutrons over protons, is of paramount importance for the radioactive properties or stability of the element.

Henry's law.—The mass of a slightly soluble gas that dissolves in a definite mass of a liquid at a given temperature is very nearly directly proportional to the partial pressure of that gas. This holds for gases which do not unite chemically with the solvent.

Hess' law of constant heat summation.—The amount of heat generated by a chemical reaction is the same whether reaction takes place in one step or in several steps, or all chemical reactions which start with the same original substances and end with the same final substances liberate the same amounts of heat, irrespective of the process by which the final state is reached.

Hooke's law.—Within the elastic limit of any body the ratio of the stress to the strain produced is constant.

Humidity, absolute.—Mass of water vapor present in unit volume of the atmosphere, usually measured as grams per cubic meter. It may also be expressed in terms of the actual pressure of the water vapor present.

Huygens' theory of light.—This theory states that light is a disturbance traveling through some medium, such as the ether. Thus light is due to wave motion in ether.

Every vibrating point on the wave-front is regarded as the center of a new disturbance. These secondary disturbances traveling with equal velocity, are enveloped by a surface identical in its properties with the surface from which the secondary disturbances start and this surface forms the new wave-front.

Hydrogen equivalent of a substance is the number of replaceable hydrogen atoms in 1 molecule or the number of atoms of hydrogen with which 1 molecule could react.

Hydrogen ion concentration.—The concentration of hydrogen ions in solution when the concentration is expressed as gram-ionic weights per liter. A convenient form of expressing hydrogen ion concentration is in terms of the negative logarithm of this concentration. The negative logarithm of the hydrogen ion concentration is called pH. The significance of pH is still in dispute (ref. J. Am Chem. Soc. 60, 1094 (1938)).

Water at 25°C has a concentration of H ion of 10^{-7} and of OH ion of 10^{-7} moles per liter. Thus the pH of water is 7 at 24°C. A greater accuracy is obtained if one substitutes the thermodynamic activity of the ion for its concentration.

Hydrolysis is a double decomposition reaction involving the splitting of water into its ions and the formation of a weak acid or base or both.

Hydrostatic pressure at a distance h from the surface of a liquid of density d,

$$P = hdg.$$

The total force on an area A due to hydrostatic pressure,

$$F = PA = Ahdg.$$

Force in dynes and pressure in dynes per cm² will be given if h is in cm, d in g per cm³ and g in cm per sec².

Hyperon.—Any article with mass intermediate between that of the neutron and the deuteron.—See *Meson*

Hysteresis.—The magnetization of a sample of iron or steel due to a magnetic field which is made to vary through a cycle of values, lags behind the field. This phenomenon is called hysteresis.

Steinmetz' equation for hysteresis gives the loss of energy in ergs per cycle per cm³,

$$W = \eta B^{1.6}$$

where B is the maximum induction in maxwells per cm² and η the coefficient of hysteresis.

Illumination on any surface is measured by the luminous flux incident on unit area. The units in use are: the **lux,** one lumen per square meter; the **phot,** one lumen per square centimeter and the lumen per square foot. Since at unit distance from a point source of unit intensity the illumination is unity, unit illumination may be defined as that produced by a unit source at unit distance, hence the **meter-candle** or **candle-meter** which is equal to the lux and the **foot-candle** equivalent to one lumen per square foot.

Indeterminancy principle (**Uncertainty principle**).—The postulate that it is impossible to determine simultaneously both the exact position and the exact momentum of an electron. So this aspect of electronics can only be expressed as a probability.

Index of refraction for any substance is the ratio of the velocity of light in a vacuum to its velocity in the substance. It is also the ratio of the sine of the angle of incidence to the sine of the angle of refraction. In general, the index of refraction for any substance varies with the wave length of the refracted light.

Indicators are substances which change from one color to another when the hydrogen ion concentration reaches a certain value, different for each indicator.

Induced electromotive force in a circuit is proportional to the rate of change of magnetic flux through the circuit.

$$E = -\frac{d\phi}{dt}$$

where $d\phi$ is the change of magnetic flux in a time dt. The induced current will be given by

$$I = \frac{d\phi}{Rdt}$$

where R is the resistance of the circuit.

Inductance.—The change in magnetic field due to the variation of a current in a conducting circuit causes an induced counter electromotive force in the circuit itself. This phenomenon is known as **self-induction.** If an electromotive force is induced in a neighboring circuit the term mutual induction is used. Inductance may thus be distinguished as self- or mutual and is measured by the electromotive force produced in a conductor by unit rate of variation of the current. Units of inductance are the centimeter (absolute electromagnetic) and the henry, which is equal to 10^9 centimeters of inductance. The **henry** is that inductance in which an induced electromotive force of one volt is produced when the inducing current is changed at the rate of one ampere per second. Dimensions,—$[\epsilon^{-1}\, l^{-1}\, t^2]$; $[\mu l]$.

Induction.—Any change in the intensity or direction of a magnetic field causes an electromotive force in any conductor in the field. The induced electromotive force generates an induced current if the conductor forms a closed circuit.

Inertia.—The resistance offered by a body to a change of its state of rest or motion, a fundamental property of matter. Dimension,—$[m]$.

Intensity of illumination in candle meters of a screen illuminated by a source of illuminating power P candles at a distance r meters, for normal incidence,

$$I = \frac{P}{r^2}$$

If two sources of illuminating power P_1 and P_2 produce equal illumination on a screen when at distances r_1 and r_2 respectively,

$$\frac{P_1}{r_1{}^2} = \frac{P_2}{r_2{}^2} \qquad \text{or} \qquad \frac{P_1}{P_2} = \frac{r_1{}^2}{r_2{}^2}$$

If I_o is the intensity of illumination when the screen is normal to the incident light, I the intensity when an angle θ

$$I = I_o \cos \theta$$

Intensity of magnetization is given by the quotient of the magnetic moment of a magnet by its volume. Unit intensity of magnetization is the intensity of a magnet which has unit magnetic moment per cubic centimeter. Dimensions,—$[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{3}{2}}]$; $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{1}{2}}\, t^{-1}]$.

Intensity of radiation is the rate of transfer of energy across unit areas by the radiation. In all forms of energy transfer by waves (radiation) the intensity I is given by I = Uv where U is the energy density of the wave in the medium, and v is the velocity of propagation of the wave. The energy density U is always proportional to the square of the wave amplitude.

Intensity of sound depends upon the energy of the wave motion. The intensity is measured by the energy in ergs transmitted per second through one square centimeter of surface. The energy in ergs per cm^3 in a sound wave is given by

$$E = 2\pi^2 dn^2 a^2$$

where d is density in g per cm^3, n is frequency in vib. per sec and a is amplitude in cm. The energy reaching the ear in unit time will also be proportional to the velocity of propagation.

Iodine number (**value**).—A number expressing the percentage (i.e. grams per 100 grams) of iodine absorbed by a substance. It is a measure of the proportion of unsaturated linkages present and is usually determined in the analysis of oils and fats.

Ion.—An ion is an atom or group of atoms that is not electrically neutral but instead carries a positive or negative electric charge. Positive ions are formed when neutral atoms or molecules lose valence electrons; negative ions are those which have gained electrons.

Ionization potential.—The work (expressed in electron volts) required to remove a given electron from its atomic orbit and place it at rest at an infinite distance. It is customary to list values in electron volts (ev.) 1 ev. = 23,053 calories per mole.

Isobars.—For chemistry, elements of the same atomic mass but of different atomic numbers. The sum of their nucleons is the same but there are more protons in one than in the other.

Isomerism.—Existence of molecules having the same number and kinds of atoms but in different configurations.

Isothermal.—When a gas passes through a series of pressure and volume variations without change of temperature the changes are called isothermal. A line on a pressure-volume diagram representing these changes is called an isothermal line.

Isotopes.—Two or more nuclides having the same atomic number, hence constituting the same element, but differing in mass number. Isotopes of a given element have the same number of nuclear protons but differing numbers of neutrons. Naturally occurring chemical elements are usually mixtures of isotopes so that observed (non-integer) atomic weights are average values for the mixture.—See *Atomic number*

Joule-Thomson effect.—The cooling which occurs when a highly compressed gas is allowed to expand in such a way that no external work is done is known as the Joule-Thomson effect. This cooling is inversely proportional to the square of the absolute temperature.

Kepler's laws.

I. The planets move about the sun in ellipses, at one focus of which the sun is situated.

II. The radius vector joining each planet with the sun describes equal areas in equal times.

III. The cubes of the mean distances of the planets from the sun are proportional to the squares of their times of revolution about the sun.

Kerr effect.—When plane polarized light is incident on the pole of an electromagnet, polished so as to act like a mirror, the plane of polarization of the reflected light is not the same when the magnet is "on" as when it is "off." It was found that the direction of rotation was opposite to that of the currents exciting the pole from which the light was reflected.

Kinetic theory, expression for pressure.

$$P = \tfrac{1}{3}Nmv^2$$

where N is the number of molecules in unit volume, m the mass of each molecule and v^2 the mean square of the velocity of the molecules.

Kinetic theory of gases.—1738.—Gases are considered to be made up of minute, perfectly elastic particles which are ceaselessly moving about with high velocities, colliding with each other and with the walls of the containing vessel. The pressure exerted by a gas is due to the combined effect of the impacts of the moving molecules upon the walls of the containing vessel, the magnitude of the pressure being dependent upon the kinetic energy of the molecules and their number.

Kirchhoff's laws.

I. The algebraic sum of the currents which meet at any point is zero.

II. In any closed circuit the algebraic sum of the products of the current and the resistance in each conductor in the circuit is equal to the electromotive force in the circuit.

Kirchhoff's laws of radiation.—The relation between the powers of emission and the powers of absorption for rays of the same wave-length is constant for all bodies at the same temperature. First, a substance when excited by some means or other possess a certain power of emission; it tends to emit definite rays, whose wave-lengths depend upon the nature of the substance and upon the temperature. Second, the substance exerts a definite absorptive power, which is a maximum for the rays it tends to emit. Third, at a given temperature the ratio between the emissive and the absorptive power for a given wave-length is the same for all bodies, and is equal to the emissive power of a perfectly black body.

Kohlrausch's law.—When ionization is complete, the conductivity of an electrolyte is equal to the sum of the conductivities of the ions into which the substance dissociates.

Kundt's law.—On approaching an absorption band from the red side of the spectrum the refractive index is abnormally increased by the presence of the band, while the approach is from the blue side and the index is abnormally decreased.

Lambert is the unit of brightness equal to $1/\pi$ candle per square centimeter.

Lambert's law of absorption.—Each layer of equal thickness absorbs an equal fraction of the light which traverses it.

Lambert's law of illumination.—The illumination of a surface on which the light falls normally from a point source is inversely proportional to the square of the distance of the surface from the source. If the normal to the surface makes an angle with the direction of the rays, the illumination is proportional to the cosine of that angle.

Lanthanide series (Lanthanides).—Rare earth elements of atomic numbers 57 through 71, which have chemical properties similar to lanthanum (#57).

Latent heat of vaporization.—The quantity of heat necessary to change one gram of liquid to vapor without change of temperature, measured as calories per gram. Dimensions,—$[l^2\, t^{-2}]$.

Lattice energy.—The energy required to separate the ions of a crystal to an infinite distance from each other.

LeChatelier's principle.—If some stress is brought to bear upon a system in equilibrium, a change occurs, such that the equilibrium is displaced in a direction which tends to undo the effect of the stress.

Length, units of.—The centimeter, one of the three fundamental units of the cgs system, is one one-hundredth the length of the International Prototype Meter, at Paris, at zero degrees centigrade. The meter is 1,553,164.13 times the wave length of the red cadmium line in air, 760 mm pressure, 15°C. The standard in the British system is the yard, the prototype of which is kept by the British government. The United States standard yard is defined as $\frac{3600}{3937}$ meter.

Lenses.—For a single thin lens whose surfaces have radii of curvature r_1 and r_2 whose principal focus is F, the index of refraction n, and conjugate focal distances f_1 and f_2,

$$\frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} = (n - 1)\left(\frac{1}{r_1} + \frac{1}{r_2}\right)$$

For a thick lens, of thickness t,

$$F = \frac{n r_1 r_2}{(n - 1)[n(r_1 + r_2) - t(n - 1)]}$$

Combinations of lenses.—If f_1 and f_2 are the focal lengths of two thin lenses separated by a distance d the focal length of the system,

$$F = \frac{f_1 f_2}{f_1 + f_2 - d}$$

Lenz's law.—When an electromotive force is induced in a conductor by any change in the relation between the conductor and the magnetic field, the direction of the electromotive force is such as to produce a current whose magnetic field will oppose the change.

Line of force.—A term employed in the description of an electric or magnetic field. A line such that its direction at every point is the same as the direction of the force which would act on a small positive charge (or pole) placed at that point. A line of force is defined as starting from a positive charge (or pole) and ending on a negative charge (or pole).

The line (of force) is also used as a unit of magnetic flux, equivalent to the maxwell.

Lissajous figures.—The path described by a particle which is simultaneously displaced by two simple harmonic motions at right angles, when the periods of the two motions are in the ratio of two small whole numbers, shows a variety of characteristic curves called Lissajous figures.

Liquid.—A state of matter in which the molecules are relatively free to change their positions with respect to each other but restricted by cohesive forces so as to maintain a relatively fixed volume.

Loschmidt's number.—The number of molecules per unit volume of an ideal gas at 0°C and normal atmospheric pressure.

$$n_o = 2.687 \times 10^{19} \text{ per cm}^3.$$

Loudness.—The psychological response of the ear which is related to the physical quantity *intensity*. The loudness of a sound depends on frequency also since the ear responds more strongly to some frequency bands than to others. The loudness is roughly related to the cube root of the intensity, and for many purposes it is convenient to represent loudness as proportional to the logarithm of the intensity.

Lumen.—The lumen is the unit of luminous flux. It is equal to the luminous flux through a unit-solid angle (steradian) from a uniform point source of one candle, or to the flux on a unit surface all points of which are at unit distance from a uniform point source of one candle.

Luminous flux.—The total visible energy emitted by a source per unit time is called the total luminous flux from the source. The unit of flux, the **lumen,** is the flux emitted in unit solid angle (steradian) by a point source of one candle luminous intensity. A uniform point source of one candle intensity thus emits 4π lumens.

Luminous intensity or candle-power is the property of a source of emitting luminous flux and may be measured by the luminous flux emitted per unit solid angle. The accepted unit of luminous intensity is the **international candle.** The **Hefner unit,** which is equivalent to 0.9 international candles, is the intensity of a lamp of specified design burning amyl acetate, called the Hefner lamp.

The mean horizontal candle-power is the average intensity measured in a horizontal plane passing through the source. The mean spherical candle-power is the average candle-power measured in all directions and is equal to the total luminous flux in lumens divided by 4π.

Magnetic field due to a current.—The intensity of the magnetic field in oersted at the center of a circular conductor of radius r in which a current I in absolute electromagnetic units if flowing,

$$H = \frac{2\pi I}{r}$$

If the circular coil has n turns the magnetic intensity at the center is,

$$H = \frac{2\pi n I}{r}$$

The magnetic field in a long solenoid of n turns per centimeter carrying a current I in absolute electromagnetic units

$$H = 4\pi n I$$

If I is given in amperes the above formulae become,—

$$H = \frac{2\pi I}{10r}, \qquad H = \frac{2\pi n I}{10r}, \qquad H = \frac{4\pi n I}{10}$$

Magnetic field due to a magnet.—At a point on the magnetic axis prolonged, at a distance r cm from the center of the magnet of length $2l$ whose poles are $+m$ and $-m$ and magnetic moment M, the field strength in oersted is,

$$H = \frac{4mlr}{(r^2 - l^2)^2}$$

If r is large compared with l,

$$H = \frac{2M}{r^3}$$

At a point on a line bisecting the magnet at right angles, with corresponding symbols,

$$H = \frac{2ml}{(r^2 + l^2)^{\frac{3}{2}}}$$

For large value of r,

$$H = \frac{M}{r^3}$$

Magnetic field intensity or magnetizing force.—Is measured by the force acting on unit pole. Unit field intensity, the oersted, is that field which exerts a force of one dyne on unit magnetic pole. The field intensity is also specified by the number of lines of force intersecting unit area normal to the field, equal numerically to the field strength in oersted. Magnetizing force is measured by the space rate of variation of magnetic potential and as such its unit may be the **gilbert per centimeter.** The gamma (γ) is equivalent to 0.00001 oersted. Dimensions,—$[\epsilon^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-2}]$; $[\mu^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{1}{2}}\, t^{-1}]$.

Magnetic flux through any area perpendicular to a magnetic field is measured as the product of the area by the field strength. The units of magnetic flux, the **maxwell** is the flux through a square centimeter normal to a field of one gauss. The line is also a unit of flux. It is equivalent to the maxwell. Dimensions,—$[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}]$; $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{3}{2}}\, t^{-1}]$.

Magnetic induction resulting when any substance is subjected to a magnetic field is measured as the magnetic flux per unit area taken perpendicular to the direction of the flux. The unit is the maxwell per square centimeter or its equivalent, the gauss. Dimensions,—$[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{3}{2}}]$; $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{1}{2}}\, t^{-1}]$.

If a substance of permeability μ is placed in a magnetic field H the magnetic induction in the substance,

$$\mathbf{M} = \mu H.$$

If I is the magnetic moment for unit volume, or intensity of magnetization,

$$\mathbf{M} = H + 4\pi I.$$

The susceptibility,

$$\kappa = \frac{I}{H}, \qquad \mu = 1 + 4\pi\kappa.$$

Magnetic moment of a magnet is measured by the torque experienced when it is at right angles to a uniform field of unit intensity. The value of the magnetic moment is given by the product of the magnetic pole strength by the distance between the poles. Unit magnetic moment is that possessed by a magnet formed by two poles of opposite sign and of unit strength, one centimeter apart. Dimensions,—$[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{5}{2}}\, t^{-1}]$; $[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{3}{2}}]$.

If the poles are separated by a distance which is great compared with the dimensions of the magnet, the magnetic moment of a magnet of length 1 whose poles have values of $+m$ and $-m$ is,

$$\mathrm{m} = ml.$$

Magnetic permeability is a property of materials modifying the action of magnetic poles placed therein and modifying the magnetic induction resulting when the material is subjected to a magnetic field or magnetizing force. The permeability of a substance may be defined as the ratio of the magnetic induction in the substance to the magnetizing field to which it is subjected. The permeability of a vacuum is unity. Dimensions,—$[\epsilon^{-1}\, l^{-2}\, t^{2}]$; $[\mu]$.

Magnetic pole or quantity of magnetism.—Two unit quantities of magnetism concentrated at points unit distance apart in a vacuum repel each other with unit force. If the distance involved is one centimeter and the force one dyne, the quantity of magnetism at each point is one cgs unit of magnetism. Dimensions,—$[\epsilon^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}]$; $[\mu^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{3}{2}}\ t^{-1}]$.

Magnetic potential or magnetomotive force at a point is measured by the work required to bring unit positive pole from an infinite distance (zero potential) to the point. The unit is the *gilbert*, that magnetic potential against which an erg of work is done when unit magnetic pole is transferred. Dimensions, —$[\epsilon^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{3}{2}}\ t^{-2}]$; $[\mu^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}\ t^{-1}]$.

Magnifying power of an optical instrument is the ratio of the angle subtended by the image of the object seen through the instrument to the angle subtended by the object when seen by the unaided eye. In the case of the microscope or simple magnifier the object as viewed by the unaided eye is supposed to be a distance of 25 cm (10 in.).

Mass.—Quantity of matter. **Units of mass**—the gram is $\frac{1}{1000}$ the quantity of matter in the International Prototype Kilogram; one of the three fundamental units of the cgs system. The British standard of mass is the pound, of which a standard is preserved by the government. The United States standard mass is the avoirdupois pound defined as 1/2.20462 kilogram.

Mass action, law of.—At a constant temperature the product of the active masses on one side of a chemical equation when divided by the product of the active masses on the other side of the chemical equation is a constant, regardless of the amounts of each substance present at the beginning of the action.

At constant temperature the rate of the reaction is proportional to the concentration of each kind of substance taking part in the reaction.

Mass by weighing on a balance with unequal arms.—If W_1 is the value for one side, W_2 the value for the other, the true mass,

$$W = \sqrt{W_1 W_2}.$$

Mass defect.—Difference between atomic mass and mass number of a nuclide.—See *Packing fraction*

Mass-energy equivalence.—The equivalence of a quantity of mass and a quantity of energy when the two quantities are related by the equation $E = mc^2$. The conversion factor c^2 is the square of the velocity of light. The relationship was developed from **relativity theory,** but has been experimentally confirmed.

Maxwell.—The cgs emu magnetic flux is the flux through a cm² normal to a field at 1 cm from a unit magnetic pole.

Maxwell's rule.—A law stating that every part of an electric circuit is acted upon by a force tending to move it in such a direction as to enclose the maximum amount of magnetic flux.

Mechanical equivalent of heat is the quantity of energy which, when transformed into heat, is equivalent to unit quantity of heat; 4.18×10^7 ergs = 1 calorie (20°C).

Meson.—Two types of particles of mass intermediate between that of the electron and proton have been discovered in cosmic radiation and in the laboratory. The one particle with mass about $215m_e$ is called μ-meson, the other with about $280m_e$ π-meson. Mesons of both positive and negative charge have been found and there is now reasonably good evidence for neutral mesons. Both types of mesons decay spontaneously. Some evidence exists for a meson of mass about $1000m_e$.

Metallic elements in general are distinguished from the non-metallic elements by their lustre, malleability, conductivity and usual ability to form positive ions. **Non-metallic** elements are not malleable, have low conductivity and never form positive ions.

Mev.—Mev = million electron volts.

Minimum deviation.—The deviation or change of direction of light passing through a prism is a minimum when the angle of incidence is equal to the angle of emergence. If D is the angle of minimum deviation and A the angle of the prism, the index of refraction of the prism for the wave length used is,

$$n = \frac{\sin \frac{1}{2}(A + D)}{\sin \frac{1}{2}A}$$

Mixtures consist of two or more substances intermingled with no constant percentage composition, and with each component retaining its essential original properties.

Moderator.—A material used for slowing down neutrons in an atomic pile or reactor. Usually graphite or "heavy water" is deuterium oxide.

Modulus of elasticity.—The stress required to produce unit strain, which may be a change of length (Young's modulus): a twist or shear (modulus of rigidity or modulus of torsion) or a change of volume (bulk modulus), expressed in dynes per square centimeter. Dimensions,—the same as of stress, $[m\, l^{-1}\, t^{-2}]$.

Mol volume.—The volume occupied by a mol or a gram molecular weight of any gas measured at standard conditions is 22.414 liters.

A **molal solution** contains one mole per 1000 grams of solvent.

A **molar solution** contains one mole or gram molecular weight of the solute in one liter of solution.

Mole.—Mass numerically equal to the molecular weight. It is most frequently expressed as the gram molecular weight, i. e. as the weight of one mole expressed in grams.

Molecular volume.—Volume occupied by one mole. Numerically equal to the molecular weight divided by the density.

Molecular weight.—The sum of the atomic weights of all the atoms in a molecule.

Molecule.—The smallest unit quantity of matter which can exist by itself and retain all the properties of the original substance.

Moment of force or torque.—The effectiveness of a force to produce rotation about an axis, measured by the product of the force and the perpendicular distance from the line of action of the force to the axis. Cgs unit—the dyne-centimeter. Dimensions,—$[m\, l^2\, t^{-2}]$. If a force F acts to produce rotation about a center at a distance d from the line in which the force acts, the force has a torque,

$$L = Fd.$$

Moment of inertia.—A measure of the effectiveness of mass in rotation. In the rotation of a rigid body not only the body's mass, but the distribution of the mass about the axis of rotation determines the change in the angular velocity resulting from the action of a given torque for a given time. Moment of inertia in rotation is analogous to mass (inertia) in simple translation. The cgs unit is g-cm². Dimensions,—$[m\, l^2]$.

If m_1, m_2, m_3, etc. represent the masses of infinitely small particles of a body; r_1, r_2, r_3, etc. their respective distances from an axis of rotation, the moment of inertia about this axis will be

$$I = (m_1r_1^2 + m_2r_2^2 + m_3r_3^2 + \cdots)$$

or

$$I = \Sigma(mr^2)$$

Momentum.—Quantity of motion measured by the product of mass and velocity. Cgs unit—, one gram-centimeter per second. Dimensions,—$[m\, l\, t^{-1}]$.

A mass m moving with velocity v has a momentum,

$$M = mv.$$

If a mass m has its velocity changed from v_1 to v_2 by the action of a force F for a time t,

$$mv_2 - mv_1 = Ft.$$

Monochromatic emissive power is the ratio of the energy of certain defined wave lengths radiated at definite temperatures to the energy of the same wave lengths radiated by a black body at the same temperature and under the same conditions.

Monotropic.—Crystal forms one of which is always metastable with respect to the other.

Mosley's law.—The frequencies of the characteristic X-rays of the elements show a strict linear relationship with the square of the atomic number.

Motion, laws of.—See *Newton's law of motion*

Multiple proportions, law of.—If two elements form more than one compound, the weights of the first element which combine with a fixed weight of the second element are in the ratio of integers to each other.

Negatron.—1. A term used for electron when it is necessary to distinguish between (negative) electrons and positrons. 2. A four element vacuum tube which displays a negative resistance characteristic.

Nernst effect.—When heat flows across the lines of magnetic force, there is observed an electromotive force in the mutually perpendicular direction.

Neutralization is a reaction in which the hydrogen ion of an acid and the hydroxyl ion of a base unite to form water, the other product being a salt.

Neutrino.—A neutral particle of very small (possibly zero) rest mass and of spin quantum number $\frac{1}{2}$. Postulated by Fermi in explaining the beta decay process.

Whenever a beta particle is emitted from a radioactive nucleus a neutrino is also created and ejected. The neutrino and beta particle share between them the available energy and momentum. The neutrino, like the photon, carries no electrical charge and has no mass other than that associated with its energy. Neutrinos are exceedingly penetrating, and are able to traverse millions of miles of matter without appreciable attenuation.

Neutron.—A neutral elementary particle of mass number 1. It is believed to be a constituent particle of all nuclei of mass number greater than 1. It is unstable with respect to beta-decay, with a half life of about 12 minutes. It produces no detectable primary ionization in its passage through matter, but interacts with matter predominantly by collisions and, to a lesser extent, magnetically. Some properties of the neutron are: rest mass, 1.00894 atomic mass unit; charge, 0; spin quantum number, $\frac{1}{2}$; magnetic moment, -1.9125 nuclear Bohr *magnetons*.

Neutron cross section.—See *cross section*

Newton's law of cooling.—The rate of cooling of a body under given conditions is proportional to the temperature difference between the body and its surroundings.

Newton's law of motion.

I. Every body continues in its state of rest or of uniform motion in a straight line except in so far as it may be compelled to change that state by the action of some outside force.

II. Change of motion is proportional to force applied and takes place in the direction of the line of action of the force.

III. To every action there is always an equal and opposite reaction.

Nodal points.—Two points on the axis of a lens such that a ray entering the lens in the direction of one, leaves as if from the other and parallel to the original direction.

A **normal salt** is an ionic compound containing neither replaceable hydrogen nor hydroxyl ions.

A **normal solution** contains one gram molecular weight of the dissolved substance divided by the hydrogen equivalent of the substance (that is, one gram equivalent) per liter of solution.

Nuclear atom.—The atom of each element consists of a small dense nucleus which includes most of the mass of the atom. The nucleus is made up of roughly equal numbers of neutrons and protons. The positive charges of the protons enables the nucleus to surround itself with a set of negatively charged electrons which move around the nucleus in complicated orbits with well defined energies. The outermost electrons which are least tightly bound to the nucleus play the dominant part in determining the physical and chemical properties of the atom. There are as many electrons in orbits as there are protons in the nucleus.

Nuclear fusion.—See *fusion*

Nuclear isomers.—Isotopes of elements having the same mass number and atomic number but differing in radioactive properties such as half-life period.

Nucleon.—Any particle found in the structure of an atom's nucleus. The most plentiful ones are neutrons and protons.

Nucleus.—The dense central core of the atom, in which most of the mass and all of the positive charge is concentrated. The charge on the nucleus, an integral multiple of Z of the electronic charge, is the essential factor which distinguishes one element from another. Z is called the atomic number and gives the number of protons in the nucleus, which includes a roughly equal number of neutrons. The mass number A gives the total number of neutrons plus protons.—See *Isotopes and Nuclear Atom*

Nuclide.—A species of atom distinguished by the constitution of its nucleus. The nuclear constitution is specified by the number of protons, Z; number of neutrons, N; and energy content. (Or, by the atomic number, Z; mass number A $(= N + Z)$ and atomic mass.)

Numerical aperture is the sine of half the angular aperture, used as a measure of the optical power of an objective.

Oersted.—The cgs emu of magnetic intensity exists at a point where a force of 1 dyne acts upon a unit magnetic pole at that point, i.e., the intensity 1 cm from a unit magnetic pole.

Ohm's law.—Current in terms of electromotive force E and resistance R.

$$I = \frac{E}{R}.$$

The current is given in amperes when E is in volts and R in ohms.

Organ pipes.—The frequency of vibration of a closed pipe or other air column of length l, where V is the velocity of sound in air, for the fundamental and first three overtones respectively is,

$$n_o = \frac{V}{4l}, \quad n_1 = \frac{3V}{4l}, \quad n_2 = \frac{5V}{4l}, \quad n_3 = \frac{7V}{4l}$$

For an open pipe,

$$n_o = \frac{V}{2l}, \quad n_1 = \frac{2V}{2l}, \quad n_2 = \frac{3V}{2l}, \quad n_3 = \frac{4V}{2l}$$

Oxidation is any process which increases the proportion of oxygen or acid-forming element or radical in a compound.

Packing fraction.—Packing fraction is the difference between the actual mass of the isotope and the nearest whole number divided by the mass number. Thus the packing fraction is equal to $(M - A)/A$ where M is the actual mass and A is the mass number. For example, one of the chlorine isotopes has a mass of 32.9860. The packing fraction for this isotope is

$$\frac{32.9860 - 33.0000}{33.0000} = -0.00042$$

Packing fractions are usually expressed as parts per 10,000 and so the packing fraction for this isotope of chlorine is written as -4.2. Since oxygen is taken as the standard, elements with positive packing fractions are less stable than oxygen, those with negative packing fractions are more stable.

It is positive for nuclides with mass number 16 or greater than 180 and negative for most others.

Paramagnetic materials.—Those within which an applied magnetic field is slightly increased by the alignment of electron orbits. The slight diamagnetic effect in materials having magnetic dipole moments is overshadowed by this paramagnetic alignment. As the temperature increases this paramagnetism disappears leaving only diamagnetism. The permeability of paramagmetic materials is slightly greater than that of empty space.

Pascal's law.—Pressure exerted at any point upon a confined liquid is transmitted undiminished in all directions.

Peltier effect.—When a current flows across the junction of two unlike metals it gives rise to an absorption or liberation of heat. If the current flows in the same direction as the current at the hot junction in a thermoelectric circuit of the two metals, heat is absorbed; if it flows in the same direction as the current at the cold junction of the thermoelectric circuit heat is liberated.

Pendulum.—For a simple pendulum of length l, for a small amplitude, the complete period,

$$T = 2\pi \sqrt{\frac{l}{g}} \quad \text{or} \quad g = 4\pi^2 \frac{l}{T^2}$$

T will be given in seconds if l is in cm and g in cm per sec². For a sphere suspended by a wire of negligible mass where d is the distance from the knife edge to the center of the sphere whose radius is r, the length of the equivalent simple pendulum,

$$l = d + \frac{2r^2}{5d}$$

If the period is P for an arc θ, the time of vibration in an infinitely small arc is approximately

$$T = \frac{P}{1 + \frac{1}{4} \sin^2 \frac{\theta}{4}}$$

For a compound pendulum, if a body of mass m be suspended from a point about which its moment of inertia is I with its center of gravity a distance h below the point of suspension, the period

$$T = 2\pi \sqrt{\frac{I}{mgh}}$$

Period in uniform circular motion is the time of one complete revolution. In any oscillatory motion it is the time of a complete oscillation. Dimension,—$[t]$.

Periodic law.—Elements when arranged in the order of their atomic weights or atomic numbers show regular variations in most of their physical and chemical properties.

Permeance, the reciprocal of reluctance. Unit permeance is the permeance of a cylinder one square centimeter cross-section and one centimeter length taken in a vacuum. Dimensions—$[\epsilon^{-1} l^{-1} t^2]$; $[\mu l]$.

Phase of oscillatory motion.—The fraction of a whole period which has elapsed since the moving particle last passed through its middle position in a positive direction.

Photographic density.—The density D of silver deposit on a photographic plate or film is defined by the relation

$$D = \log O$$

where O is the opacity. If I_o and I are the incident and transmitted intensities respectively the opacity is given by I_o/I. The transparency is the reciprocal of the opacity or I/I_o.

Photon.—A photon (or γ-ray) is a quantum of electromagnetic radiation which has zero rest mass and an energy of h (Planck's constant) times the frequency of the radiation. Photons are generated in collisions between nuclei or electrons and in any other process in which an electrically charged particle changes its momentum. Conversely photons can be absorbed (i.e., annihilated) by any charged particle.

Piezo-electric effect.—The phenomenon exhibited by certain crystals of expansion along one axis and contraction along another when subjected to an electric field. Conversely compression of certain crystals generate an electrostatic voltage across the crystal. Piezoelectricity is only possible in crystal classes which do not possess a center of symmetry.

Pinch effect.—When an electric current, either direct or alternating, passes through a liquid conductor, that conductor tends to contract in cross-section, due to *electromagnetic* forces.

Pitch.—Psychological response of the ear, primarily dependent upon the frequency of vibration of the air. The intensity of the sound also has a certain effect on the pitch. Pitch of a screw is the axial distance between adjacent turns of a single thread on the screw.

Planck's constant (h).—A universal constant of nature which relates the energy of a quantum of radiation to the frequency of the oscillator which emitted it. It has the dimensions of action (energy × time). Expressed by $E = h\nu$ where E is the energy of the quantum and ν is its frequency. Its numerical value is 6.624×10^{-27} erg-sec.

Plutonium.—A fissile element, artificially produced in the pile by neutron bombardment of U^{238}.

Poise.—A unit of coefficient of viscosity, defined as the tangential force per unit area (dynes/cm^2) required to maintain unit difference in velocity (1 cm/sec) between two parallel planes separated by 1 cm of fluid;

$$1 \text{ poise} = 1 \text{ dyne sec/cm}^2 = 1 \text{ gm/cm sec.}$$

Poisson's ratio is the ratio of the transverse contraction per unit dimension of a bar of uniform cross-section to its elongation per unit length, when subjected to a tensile stress.

Polarized light.—Light which exhibits different properties in different directions at right angles to the line of propagation is said to be polarized. Specific rotation is the power of liquids to rotate the plane of polarization. It is stated in terms of specific rotation or the rotation in degrees per decimeter per unit density.

Polymorphism.—The ability to exist in two or more crystalline forms.

Positron.—A particle of the same mass M_e, as an ordinary electron. It has a positive electrical charge of exactly the same amount as that of an ordinary electron (which is sometimes called negatron). Positrons are created either by the radioactive decay of certain unstable nuclei or, together with a negatron, in a collision between an energetic (more than one Mev) photon and an electrically charged particle (or another photon). A positron does not decay spontaneously but on passing through matter it sooner or later collides with an ordinary electron and in this collision the positron-negatron pair is annihilated. The rest energy of the two particles, which is given by Einstein's relation $E = \mathrm{mc}^2$ and amounts to 1.0216 mev altogether, is converted into electromagnetic radiation in the form of one or more photons.

Potential (electric) at any point is measured by the work necessary to bring unit positive charge from an infinite distance. Difference of potential between two points is measured by the work necessary to carry unit positive charge from one to the other. If the work involved is one erg we have the electrostatic unit of potential. Dimensions,—$[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-1}]$, $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{3}{2}}\, t^{-2}]$.

The potential at a point due to a charge q at a distance r in a medium whose dielectric constant is ϵ is,

$$V = \frac{q}{\epsilon r}$$

Power.—The time rate at which work is done. Units of power,—the watt, one joule (ten million ergs) per second; the kilowatt is equal to 1000 watts; the horse-power, 33,000 foot-pounds per minute, is equal to 746 watts. Dimensions,—$[m\, l^2\, t^{-3}]$.

If an amount of work W is done in time t the power or rate of doing work is

$$P = \frac{W}{t}$$

Power will be obtained in watts if W is expressed in joules (10^7 ergs) and t in sec.

Power in watts for alternating current,

$$P = EI \cos \phi$$

where E and I are the effective values of the electromotive force and current in volts and amperes respectively and ϕ the phase angle between the current and the impressed electromotive force.

The ratio,

$$\frac{P}{EI} = \cos \phi$$

is called the power factor.

Power developed by a direct current.—The power in watts developed by an electric current flowing in a conductor, where E is the difference of potential at its terminals in volts, R its resistance in ohms, and I the current in amperes,

$$P = EI = RI^2$$

The work done in joules in a time t sec is,

$$W = EIt{:}RI^2t.$$

Power ratios in telephone engineering are measured in **decibels.** The gain or loss of power expressed in decibels is ten times the logarithm of the power ratio. By reference to an arbitrarily chosen "power level" the actual power may be expressed in decibels. The numerical values thus used will not be proportional to the actual power level but roughly to the sensation on the ear produced when the electrical power is converted into sound. A difference of 1 decibel in the power supply to a telephone receiver produces approximately the smallest change in volume of sound which a normal ear can detect.

Pressure.—Force applied to, or distributed, over a surface; measured as force per unit area. Cgs unit,—the barye, one dyne per square centimeter. The megabarye is equal to 10^6 dynes per square centimeter. Pressure is also measured by the height of the column of mercury or water which it supports. Dimensions,—$[m\, l^{-1}\, t^{-2}]$.

The pressure due to a force F distributed over an area A,

$$P = \frac{F}{A}$$

Absolute pressure.—Pressure measured with respect to zero pressure. *Gauge pressure*—pressure measured with respect to that of the atmosphere.

Principal focus of a lens or spherical mirror is the point of convergence of light coming from a source at an infinite distance.

Projectiles.—For bodies projected with velocity v at an angle a above the horizontal, the time to highest point of flight.

$$t = \frac{v \sin a}{g}$$

Total time of flight to reach the original horizontal plane,

$$T = \frac{2v \sin a}{g}$$

Maximum height,

$$h = \frac{v^2 \sin^2 a}{2g}$$

Horizontal range,

$$R = \frac{v^2 \sin 2a}{g}$$

In the above equations the resistance of the air is neglected. g is the acceleration due to gravity.

Proton.—An elementary particle having a positive charge equivalent to the negative charge of the electron but possessing a mass approximately 1837 times as great. The proton is in effect the positive nucleus of the hydrogen atom.

Purkinje effect.—A phenomenon associated with the human eye, making it more sensitive to blue light when the illumination is poor (less than about 0.1 lumen per sq. ft.) and to yellow light when the illumination is good.

Quality or timbre of a sound depends on the coexistence with the fundamental of other vibrations of various frequencies and amplitudes.

Quantity of electricity or charge.—The electrostatic unit of charge, the quantity which when concentrated at a point and placed at unit distance from an equal and similarly concentrated quantity, is repelled with unit force. If the distance is one centimeter and force of repulsion one dyne and the surrounding medium a vacuum, we have the electrostatic unity of quantity. The electrostatic unit of quantity may be defined as that transferred by electrostatic unit current in unit time. The quantity transferred by one ampere in one second is the coulomb, the practical unit. The faraday is the electrical charge carried by one gram equivalent. The coulomb = 3 × 10^9 electrostatic units. Dimensions,—

$$[\epsilon^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{3}{2}}\, t^{-1}];\ [\mu^{-2}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}].$$

Quantum.—Unit quantity of energy postulated in the quantum theory. The *photon* is a quantum of the electromagnetic field, and in nuclear field theories, the *meson* is considered to be the quantum of the nuclear field.

Radiation.—The emission and propagation of energy through space or through a material medium in the form of waves.

The term may be extended to include streams of sub-atomic particles as alpha-rays, or beta-rays, and cosmic rays as well as electromagnetic radiation. Often used to designate the energy alone without reference to its character. In the case of light this energy is transmitted in bundles (photons).

Radiation formula, Planck's.—The emissive power of a black body at wave length λ may be written

$$E_\lambda = \frac{c_1\lambda^{-5}}{e^{c_2/\lambda T} - 1}$$

where c_1 and c_2 are constants with numerical values 3.7403 × 10^8 microwatts per cm^2 per 0.01μ zone of spectrum and 14384 micron degrees, respectively and T the absolute temperature.

Radioactive nuclides.—Are atoms that disintegrate by emission of corpuscular or electromagnetic radiations. The rays most commonly emitted are alpha or beta or gamma rays. The three classes are:

1. Primary, which have life-times exceeding 10^8 years. These may be alpha-emitters or beta-emitters.
2. Secondary, which are formed in radioactive transformations starting with U^{238}, U^{235}, or Th^{232}.
3. Induced, having geologically short lifetimes and formed by induced nuclear reactions occurring in nature. All these reactions result in transmutation.

Radius of gyration may be defined as the distance from the axis of rotation at which the total mass of a body might be concentrated without changing its moment of inertia. The product of total mass and the square of the radius of gyration will give (the) moment of inertia.

Rankine scale of temperature.—The absolute Fahrenheit scale.

°F + 459.69 = °R; thus 0° Rankine = 459.69°F.

Raoult's law.—Molar weights of non-volatile non-electrolytes when dissolved in a definite weight of a given solvent under the same conditions lower the solvent's freezing point, elevate its boiling point and reduce its vapor pressure equally for all such solutes.

Reduction is any process which increases the proportion of hydrogen or base-forming elements or radicals in a compound. Reduction is also the gaining of electrons by an atom, an ion, or an element thereby reducing the positive valence of that which gained the electron.

Reflection coefficient or reflectivity is the ratio of the light reflected from a surface to the total incident light. The coefficient may refer to diffuse or to specular reflection. In general it varies with the angle of incidence and with the wavelength of the light.

Reflection of light by a transparent medium in air. (Fresnel's formulae).—If i is the angle of incidence, r the angle of refraction, n_1 the index of refraction for air (nearly equal to unity), n_2 index of refraction for a medium, then the ratio of the reflected light to the incident light is,

$$R = \frac{1}{2}\left(\frac{\sin^2 (i - r)}{\sin^2 (i + r)} + \frac{\tan^2 (i - r)}{\tan^2 (i + r)}\right)$$

If $i = 0$ (normal incidence), and $n_1 = l$ (approximate for air),

$$R = \left(\frac{n_2 - 1}{n_2 + 1}\right)^2$$

Refraction.—See *Index of refraction; Snell's law.*

Refraction at a spherical surface.—If u be the distance of a point source, v the distance of the point image or the intersection of the refracted ray with the axis, n_1 and n_2 the indices of refraction of the first and second medium, and r the radius of curvature of the separating surface,

$$\frac{n_2}{v} + \frac{n_1}{u} = \frac{n_2 - n_1}{r}$$

If the first medium is air the equation becomes,

$$\frac{n}{v} + \frac{1}{u} = \frac{n - 1}{r}$$

Refractivity is given by $(n - 1)$ when n is the index of refraction; the **specific refractivity** is given by $\frac{n - 1}{d}$ where d is the density. **Molecular refractivity** is the product of specific refractivity by the molecular weight.

Relative humidity.—The ratio of the quantity of water vapor present in the atmosphere to the quantity which would saturate at the existing temperature. It is also the ratio of the pressure of water vapor present to the pressure of saturated water vapor at the same temperature.

Reluctance is that property of a magnetic circuit which determines the total magnetic flux in the circuit when a given magnetomotive force is applied. Unit, the reluctance of one centimeter length and one square centimeter cross-section of space taken in a vacuum. Dimensions,—$[\epsilon l\, t^{-2}]$; $[\mu^{-1}\, l^{-1}]$.

Reluctivity or specific reluctance is the reciprocal of magnetic permeability. The reluctivity of empty space is taken as unity. Dimensions,—$[\epsilon l^2\, t^{-2}]$; $[\mu^{-1}]$.

Resistance is a property of conductors depending on their dimensions, material and temperature which determines the current produced by a given difference of potential. The practical unit of resistance, the **ohm** is that resistance through which a difference of potential of one volt will produce a current of one ampere. The **international ohm** is the resistance offered to an unvarying current by a column of mercury at 0°C, 14.4521 grams in mass, of constant cross-sectional area and 106.300 centimeters in length, sometimes called the legal ohm. Dimensions,—$[\epsilon^{-1}\, l^{-1}\, t]$; $[\mu l\, t^{-1}]$.

Resistance of a conductor at 0°C, of length l, cross-section s and specific resistance ρ

$$R_o = \rho \frac{l}{s}$$

The resistivity may be expressed as ohm-cm when R is in ohms, l in cm and s in cm².

Resistance of a conductor at a temperature t whose resistance at 0°C is R_o and whose temperature resistance coefficient is α

$$R_t = R_o(1 + \alpha t)$$

Resistance of conductors in series and parallel.—The total resistance of any number of resistances joined in series is the sum of the separate resistances. The total resistance of conductors in parallel whose separate resistances are r_1, r_2, r_3 . . . r_n is given by the formula

$$\frac{1}{R} = \frac{1}{r_1} + \frac{1}{r_2} + \frac{1}{r_3} \cdots + \frac{1}{r_n}$$

Where R is the total resistance. For two terms this becomes,

$$R = \frac{r_1 r_2}{r_1 + r_2}$$

Resistance, specific (Resistivity).—A proportionality factor characteristic of different substances equal to the **resistance** that a centimeter cube of the substance offers to the passage of electricity, the current being perpendicular to two parallel faces. It is defined by the expression:

$$R = \rho \frac{l}{A}$$

where R is the resistance of a uniform conductor, l is its length, A is its cross sectional area, and ρ is its resistivity. Resistivity is usually expressed in ohm-centimeters.

Resolving power of a telescope or microscope is indicated by the minimum separation of two objects for which they appear distinct and separate when viewed through the instrument.

Resonance (chemical).—The moving of electrons from one atom of a molecule or ion to another atom of that molecule or ion. It is simply the oriented movement of the bonds between atoms.

Restitution, coefficient of, for two bodies on impact.—The ratio of the difference in velocity, after impact to the difference before impact.

Reversible reaction.—One which can be caused to proceed in either direction by suitable variation in the conditions of temperature, volume, pressure or of the quantities of reacting substances.

Roentgen.—A radiation unit, that amount of radiation that will produce one electrostatic unit of ions per cubic centimeter volume.

Rotatory power is the power of rotating the plane of polarized light, given in general by θ/l where θ is the total rotation which occurs in a distance l.

The **molecular** or **atomic rotatory power** is the product of the specific rotatory power by the molecular or atomic weight. Magnetic rotatory power is given by

$$\theta/e\,H\cos\alpha$$

where H the intensity of the magnetic field, and α the angle between the field and the direction of the light.

Rydberg formula.—A formula, similar to that of Balmer, for expressing the wave-numbers (ν) of the lines in a spectral series:

$$\nu = R\left[\frac{1}{(n+a)^2} - \frac{1}{(m+b)^2}\right]$$

where n and m are integers and $m > n$, a and b are constants for a particular series, and R is the *Rydberg constant*, 109677.8 cm^{-1} for hydrogen.

Salt.—Any substance which yields ions, other than hydrogen or hydroxyl ions. A salt is obtained by displacing the hydrogen of an acid by a metal.

Scintillometer.—An instrument which detects radiation by emitting flashes of light.

Seebeck effect.—If a circuit consists of two metals, one junction hotter than the other, a current flows in the circuit. The direction of the flow depends on the metals and the temperature of the junctions.

Sensitiveness of a balance.—Assuming the three knife edges of a balance to lie on a straight line,—if M is the weight of the beam, h the distance of the center of gravity below the knife edge, L the length of the balance arms and m a small mass added to one pan, the deflection θ produced is given by

$$\tan \theta = \frac{mL}{Mh}.$$

Shell.—According to *Pauli's exclusion principle* (q.v.), the extranuclear electrons do not circle around the nucleus all in orbits of the same radius, but are arranged in orbits at various distances from the nucleus. The extranuclear orbital electrons are thus assumed to be arranged in a series of concentric spheres, called *shells*, which are designated, in the order of increasing distance from the nucleus, as K, L, M, N, O, P, and Q shells. The number of the electrons which each of these shells can contain is limited. All electrons arranged in the same shell have the same principal quantum number. The electrons in the same shell are grouped into various subshells (q.v.), and all the electrons in the same subshell have the same orbital angular momentum.—See *Subshell*

Simple harmonic motion.—Periodic oscillatory motion in a straight line in which the restoring force is proportional to the displacement. If a point moves uniformly in a circle, the motion of its projection on the diameter (or any straight line in the same plane) is simple harmonic motion.

If r is the radius of the reference circle, ω the angular velocity of the point in the circle, θ the angular displacement at the time t after the particle passes the mid-point of its path, the linear displacement,

$$x = r \sin \theta = r \sin \omega t.$$

The velocity at the same instant,

$$v = r\omega \cos \theta = \omega \sqrt{r^2 - x^2}$$

The acceleration,

$$a = -\omega^2 x.$$

The force for a mass m,

$$F = m\omega^2 x = -\frac{4\pi^2 m x}{T^2}$$

The period,

$$T = 2\pi \sqrt{\frac{x}{a}}$$

In the above equations the cgs system calls for x and r in cm, v in cm per sec, a in cm per sec^2, T in sec, m in grams, F in dynes, θ in radians and ω in radians per sec.

Simple machine.—A contrivance for the transfer of energy and for increased convenience in the performance of work.

Mechanical advantage is the ratio of the resistance overcome to the force applied. Velocity ratio is the ratio of the distance through which force is applied to the distance through which resistance is overcome.

Efficiency is the ratio of the work done by a machine to the work done upon it.

If a force f applied to a machine through a distance S results in a force F exerted by the machine through a distance s, neglecting friction,

$$fS = Fs.$$

The theoretical mechanical advantage or velocity ratio in the above case is, $\frac{S}{s}$.

Actually the force obtained from the machine will have a smaller value than will satisfy the equation above. If F' be the actual force obtained, the practical mechanical advantage will be, $\frac{F'}{f}$.

The efficiency of the machine,

$$E = \frac{F's}{fS}.$$

Snell's law of refraction.—If i is the angle of incidence, r the angle of refraction, v the velocity of light in the first medium, v' the velocity in the second medium, the index of refraction n,

$$n = \frac{\sin i}{\sin r} = \frac{v}{v'}.$$

Solid.—A state of matter in which the relative motion of the molecules is restricted and they tend to retain a definite fixed position relative to each other, giving rise to crystal structure. A solid may be said to have a definite shape and volume.

Solid angle.—Measured by the ratio of the surface of the portion of a sphere enclosed by the conical surface forming the angle, to the square of the radius of the sphere. Unit of solid angle,—the steradian, the solid angle which encloses a surface on the sphere equivalent to the square of the radius. Dimensions,—unity.

Solubility of one liquid or solid in another is the mass of a substance contained in a solution which is in equilibrium with an excess of the substance. Under these conditions the solution is said to be saturated. Solubility of a gas is the ratio of concentration of gas in the solution to the concentration of gas above the solution.

Solubility product or precipitation value is the product of the concentrations of the ions of a substance in a saturated solution of the substance. These concentrations are frequently expressed as moles of solute per liter of solution.

Solute.—That constituent of a solution which is considered to be dissolved in the other, the solvent. The solvent is usually present in larger amount than the solute.

A **solution** is **saturated** if it contains at given temperature as much of a solute as it can retain in the presence of an excess of that solute.

A **true solution** is a mixture, liquid, solid or gaseous, in which the components are uniformly distributed throughout the mixture. The proportion of the constituents may be varied within certain limits.

Solvent.—That constituent of a solution which is present in larger amount; or, the constituent which is liquid in the pure state, in the case of solutions of solids or gases in liquids.

Specific gravity.—The ratio of the mass of a body to the mass of an equal volume of water at 4°C or other specified temperature. Dimensions,—unity.

Specific heat of a substance is the ratio of its thermal capacity to that of water at 15°C. Dimensions,—unity.

If a quantity of heat H calories is necessary to raise the temperature of m grams of a substance from t_1 to t_2°C, the specific heat, or more properly, thermal capacity of the substance,

$$s = \frac{H}{m(t_2 - t_1)}.$$

Specific heat by the method of mixtures.—Where a mass m_1 of the substance is heated to a temperature t_1, then placed in a mass of water m_2 at a temperature t_2 contained in a calorimeter with stirrer (of same material) of mass m_3, specific heat of the calorimeter c, t_3 the final temperature

$$m_1 s(t_1 - t_3) = m_3 c + m_2(t_3 - t_2).$$

Black's ice calorimeter.—If a body of mass m and temperature t melts a mass m' of ice, its temperature being reduced to 0°C, the specific heat of the substance is,

$$s = \frac{80\ 1m'}{mt}$$

Bunsen's ice calorimeter.—A body of mass m at temperature t causes a motion of the mercury column of l centimeters in a tube whose volume per unit length is v. The specific heat is

$$s = \frac{884lv}{mt}$$

Specific inductive capacity.—The ratio of the capacitance of a condenser with a given substance as dielectric to the capacitance of the same condenser with air or a vacuum as dielectric is called the specific inductive capacity. The ratio of the dielectric constant of a substance to that of a vacuum.

Specific rotation.—If there are n grams of active substance in v cubic centimeters of solution and the light passes through l centimeters, r being the observed rotation in degrees, the specific rotation (for 1 centimeter),

$$[\alpha] = \frac{rv}{nl}$$

Specific volume is the reciprocal of density. Dimensions,—$[m^{-1}\, l^3]$.

Spectral series are spectral lines or groups of lines which occur in an orderly sequence.

Speed.—Time rate of motion measured by the distance moved over in unit time. Cgs unit,—one centimeter per second. Dimension,—$[l\, t^{-1}]$.

Spherical aberration.—When large surfaces of spherical mirrors or lenses are used the light divergent from a point source is not exactly focused at a point. The phenomenon is known as spherical aberration. For axial pencils the error is known as axial spherical aberration; for oblique pencils, coma.

Spherical mirrors.—If R is the radius of curvature, F principal focus, and f_1 and f_2 any two conjugate focal distances,

$$\frac{1}{f_1} + \frac{1}{f_2} = \frac{1}{F} = \frac{2}{R}$$

If the linear dimensions of the object and image be O and I respectively and u and v their distances from the mirror,

$$\frac{O}{I} = \frac{u}{v}$$

Spin.—In nuclear physics, used to describe the angular momentum of elementary particles or of nuclei.

Standard conditions for gases.—Measured volumes of gases are quite generally recalculated to 0 degrees C temperature and 760 mm pressure, which have been arbitrarily chosen as standard conditions.

Stark effect.—The splitting of a single spectrum line into multiple lines which occurs when the emitting material is placed in a strong electric field. The observed effect depends on the angle between the direction of the field and the direction of observation. The effect is due to the shifting of the energy states of certain orbits which all have the same energy in zero field.

Statcoulomb.—The unit of electric charge in the metric system. 3×10^9 statcoulombs = 1 coulomb.

Stationary or standing waves are produced in a medium by the simultaneous transmission, in opposite directions of two similar wave motions. Fixed points of minimum amplitude are called **nodes.** A **segment** extends from one node to the next. An **antinode** or **loop** is the point of maximum amplitude between two nodes.

Stefan-Boltzman law of radiation.—The energy radiated in unit time by a black body is given by, $E = K(T^4 - T_o^4)$, where T is the absolute temperature of the body, T_o the absolute temperature of the surroundings, and K a constant.

Stoichiometric.—Pertaining to weight relations in chemical reactions.

Stoke.—See under viscosity.

Stoke's law.—1. Gives the rate of fall of a small sphere in a viscous fluid. When a small sphere falls under the action of gravity through a viscous medium it ultimately acquires a constant velocity,

$$V = \frac{2ga^2(d_1 - d_2)}{9\eta}$$

where a is the radius of the sphere, d_1 and d_2 the densities of the sphere and the medium respectively, and η the coefficient of viscosity. V will be in cm per sec if g is in cm per sec^2, a in cm, d_1 and d_2 in g per cm^3 and η in dyne-sec per cm^2 or poises.

2. The empirical law stating that the wavelength of light emitted by a fluorescent material is longer than that of the radiation used to excite the fluorescence. In modern language the emitted photons carry off less energy than is brought in by the exciting photons; the details accord with the energy conservation principle.

Strain.—The deformation resulting from a stress measured by the ratio of the change to the total value of the dimension in which the change occurred. Dimensions,—unity.

Stress.—The force producing or tending to produce deformation in a body measured by the force applied per unit area. Cgs units,—one dyne per square centimeter. Dimensions,—$[m\, l^{-1}\, t^{-2}]$.

Subshell.—The electrons within the same shell (energy level) of the atom are characterized by the same principal quantum number (n), and are further divided into groups according to the value of their azimuthal quantum numbers (l); the electrons which possess the same azimuthal quantum number for the same principal quantum number are considered to occupy the same subshell (or sublevel). The individual subshells are designated with the letters s, p, d, f, g, and h, as follows:

l value	designation of subshell
0	s
1	p
2	d
3	f
4	g
5	h

An electron assigned to the s-subshell is called an s-electron, one assigned to the p-subshell is referred to as a p-electron, etc. In formulae of electron structure, the value of the principal quantum number (n) is prefixed to the letter indicating the azimuthal quantum number (l) of the electron; thus, e.g., a $4f$-electron is an electron which has the principal quantum number 4 (i.e. assigned to the N-shell) and the orbital angular momentum 3(f-subshell).

Surface density of electricity.—Quantity of electricity per unit area. Dimensions,—$[\epsilon^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{1}{2}}\, t^{-1}]$; $[\mu^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{3}{2}}]$.

Surface density of magnetism.—Quantity of magnetism per unit area. Dimensions,—$[\epsilon^{-1}\, m^{\frac{1}{2}}\, l^{-\frac{3}{2}}]$, $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{1}{2}}\, t^{-1}]$.

Surface tension.—Two fluids in contact exhibit phenomena, due to molecular attractions which appear to arise from a tension in the surface of separation. It may be expressed as dynes per cm or as ergs per square centimeter. Dimensions, —$[m\, t^{-2}]$.

The total force along a line of length l on the surface of a liquid whose surface tension is T,

$$F = lT.$$

Capillary tubes.—If a liquid of density d rises a height h in a tube of internal radius r the surface tension is,

$$T = \frac{rhdg}{2}$$

The tension will be in dynes per cm if r and h are in cm, d in g per cm^3 and g in cm per sec^2.

Drops and bubbles.—Pressure in dynes per cm^2 due to surface tension on a drop of radius r cm for a liquid whose surface tension is T dynes per cm,

$$P = \frac{2T}{r}$$

For a bubble of mean radius r cm,

$$P = \frac{4T}{r}.$$

Susceptibility (magnetic) is measured by the ratio of the intensity of magnetization produced in a substance to the magnetizing force or intensity of field to which it is subjected. The susceptibility of a substance will be unity when unit intensity of magnetization is produced by a field of one gauss. Dimensions,—$[\epsilon^{-1}\, l^{-2}\, t^2]$, $[\mu]$.

Tangent galvanometer.—A tangent galvanometer with n turns, of radius r, in the earth's field H, has a deflection θ. The current flowing is,

$$i = \frac{Hr}{2\pi n} \tan \theta$$

If $\frac{2\pi n}{r} = G$ (the galvanometer constant).

$$i = \frac{H}{G} \tan \theta$$

Temperature may be defined as the condition of a body which determines the transfer of heat to or from other bodies. Particularly it is a manifestation of the average translational kinetic energy of the molecules of a substance due to heat agitation. The customary unit of temperature is the **Centigrade** degree, $\frac{1}{100}$ the difference between the temperature of melting ice and that of water boiling under standard atmospheric pressure. The degree **Fahrenheit** is $\frac{1}{180}$, and the degree **Reaumur** $\frac{1}{80}$ the same difference of temperature.

The fundamental temperature scale is the absolute, thermodynamic or **Kelvin scale** in which the temperature measure is based on the average kinetic energy per molecule of a perfect gas. The zero of the Kelvin scale is −273.18°C. The temperature scale adopted by the International Bureau of Weights and Measures is that of the constant volume hydrogen gas thermometer. The magnitude of the degree in both these scales is defined as $\frac{1}{100}$ the difference between the temperature of melting ice and that of boiling water at 760 mm pressure. Frequently the Kelvin scale is defined as degrees C + 273.16 and the Rankine scale as degrees F + 459.69°F.

The fundamental temperature scale is now defined by means of the equation

$$\theta(\mathrm{X}) = 273.16^\circ\mathrm{K}\,\frac{\mathrm{X}}{\mathrm{X}_3}$$

where θ denotes the temperature; X the thermometric property (P, V, . . .); the subscript 3 refers to the triple point of water; and 273.16°K is the arbitrary fixed point for the temperature associated with the triple point of water.

The ideal gas temperature θ, (numerically equal to the Kelvin temperature), in particular, is defined by either of the two equations:

$$\theta = \begin{cases} 273.16^\circ \lim\limits_{\mathrm{P}_3\to 0} \dfrac{\mathrm{P}}{\mathrm{P}_3}, \text{ const. V} \\ \\ 273.16^\circ \lim\limits_{\mathrm{P}\to 0} \dfrac{\mathrm{V}}{\mathrm{V}_3}, \text{ const. P} \end{cases}$$

Temperature resistance coefficient.—The ratio of the change of resistance in a wire due to a change of temperature of 1°C to its resistance at 0°C. Dimension,—$[\theta^{-1}]$.

Thermal capacity of a substance is the quantity of heat necessary to produce unit change of temperature in unit mass. It is ordinarily expressed as calories per gram per degree Centigrade. Numerically equivalent to specific heat.

Thermal capacity or water equivalent.—The total quantity of heat necessary to raise any body or system unit temperature, measured as calories per degree centigrade in the cgs system. Dimension,—$[m]$.

Thermal expansion.—The coefficient of linear expansion or expansivity is the ratio of the change in length per degree C to the length at 0°C. The coefficient of volume expansion (for solids) is approximately three times the linear coefficient. The coefficient of volume expansion for liquids is the ratio of the change in volume per degree to the volume at 0°C. The value of the coefficient varies with temperature. The coefficient of volume expansion for a gas under constant pressure is nearly the same for all gases and temperatures and is equal to 0.00367 for 1°C. Dimension,—$[\theta^{-1}]$.

If l_o is the length at 0°C, α the coefficient of linear expansion, the length at t_oC is,

$$l_t = l_o(1 + \alpha t).$$

General formula for thermal expansion.—The rate of thermal expansion varies with the temperature. The general equation giving the magnitude m_t (length or volume) at a temperature t, where m_o is the magnitude at 0°C, is

$$m_t = m_o(1 + \alpha t + \beta t^2 + \gamma t^3 \cdots)$$

where α, β, γ, etc. are empirically determined coefficients.

Volume expansion.—If V represents volume and β the coefficient of expansion,

$$V_t = V_o(1 + \beta t).$$

For solids,

$$\beta = 3\alpha \text{ (approximately).}$$

Thermal neutrons.—Neutrons slowed down by a moderator to an energy of a fraction of an electron volt—about 0.025 ev. at 15°.

Thermionic emission.—Electron or ion emission due to the temperature of the emitter. The rate of emission increases rapidly with the increase of temperature. It is also very sensitive to the state of the surface.

Thermodynamics, law of.

I. When mechanical work is transformed into heat or heat into work, the amount of work is always equivalent to the quantity of heat.

II. It is impossible by any continuous self-sustaining process for heat to be transferred from a colder to a hotter body.

Thermoelectric power is measured by the electromotive force produced by a thermocouple for unit difference of temperature between the two junctions. It varies with the average temperature and is usually expressed in microvolts per degree C. It is customary to list the thermoelectric power of the various metals with respect to lead. Dimensions,—$[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-1}\, \theta^{-1}]$; $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, t^{-1}\, \theta^{-1}]$.

Thomson thermoelectric effect is the designation of the potential gradient along a conductor which accompanies a temperature gradient. The magnitude and direction of the potential varies with the substance.

The coefficient of the Thomson effect or specific heat of electricity is expressed in joules per coulomb per degree Centigrade. Dimensions,—$[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-1}\, \theta^{-1}]$, $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{3}{2}}\, t^{-2}\, \theta^{-1}]$.

Time, unit of.—The second, $\frac{1}{86400}$ of a mean solar day. One of the three fundamental units of the cgs system.

Torque produced by the action of one magnet on another.—The turning moment experienced by a magnet of pole strength m' and length $2l'$ placed at a distance r from another magnet of length $2l$ and pole strength m, where the center of the first magnet is on the axis (extended) of the second and the axis of the first is perpendicular to the axis of the second,

$$C = 8\frac{mm'll'}{r^3} = \frac{2MM'}{r^3}$$

If the first magnet is deflected through an angle θ, the expression becomes,

$$C = \frac{2MM'}{r^3}\cos\theta$$

Torsional vibration.—See *Angular harmonic motion*

Total reflection.—When light passes from any medium to one in which the velocity is greater, refraction ceases and total reflection begins at a certain critical angle of incidence θ such that

$$\sin\theta = \frac{1}{n}$$

where n is the index of the first medium with respect to the second. If the second medium is air n has the ordinary value for the first medium. For any other second medium,

$$n = \frac{n_1}{n_2}$$

where n_1 and n_2 are the ordinary indices of refraction for the first and second medium respectively.

Tractive force of a magnet.—If a magnet with induction B has a pole face of area A the force, is,

$$F = \frac{B^2A}{8\pi}$$

If B and A are in cgs units, F will be in dynes.

Transmutation.—A nuclear change producing a new element from an old one.

Transuranic elements.—Elements of atomic numbers above 92. All of them are radioactive and are products of artificial nuclear changes. All are members of the actinide group.

Triangle or polygon of forces.—If three or more forces acting on the same point are in equilibrium, the vectors representing them form, when added, a closed figure.

Tritium.—An isotope of hydrogen with a mass of three, structure, two neutrons, and one proton in its nucleus.

Uncertainty principle.—See *Indeterminancy*

Uniform circular motion.—If r is the radius of a circle, v the linear speed in the arc, ω the angular velocity and T the period or time of one revolution,

$$\omega = \frac{v}{r} = \frac{2\pi}{T}$$

The acceleration toward the center is

$$a = \frac{v^2}{r} = \omega^2 r = \frac{4\pi^2 r}{T^2}$$

The centrifugal force for a mass m,

$$F = \frac{mv^2}{r} = m\omega^2 r = \frac{4\pi^2 mr}{T^2}$$

In the above equations ω will be in radians per second and a in cm per sec^2 if r is in cm, v in cm per sec and T in sec. F will be in dynes if mass is in grams and other units as above.

Application to the solar system.—If M is the mass of the sun, G the constant of gravitation, P the period of the planet and r the distance of the planet from the sun, then the mass of the sun

$$M = \frac{4\pi^2 r^3}{GP^2}, \ (G = 6.670 \times 10^{-8} \text{ for cgs units}).$$

If P is the period and r the distance of a satellite revolving around the planet, the above expression for M gives the mass of the planet. The formula is written on the assumption that the orbit of the planet or satellite is circular, which is only approximately true.

Uniformly accelerated rectilinear motion.—If v_o is the initial velocity, v_t the velocity after time t, the acceleration,

$$a = \frac{v_t - v_o}{t}$$

The velocity after time t,

$$v_t = v_o + at$$

Space passed over in time t,

$$s = v_o t + \tfrac{1}{2}at^2$$

Velocity after passing over space s,

$$v = \sqrt{v_o^2 + 2as}$$

Space passed over in the nth second

$$s = v_o + \tfrac{1}{2}a(2n - 1).$$

In the above and following similar equations the values of the space, velocity, and acceleration must be substituted in the same system. For space in *cm*, velocity will be in *cm* per sec and acceleration in *cm* per sec per sec.

Unit.—Specific magnitude of a quantity, set apart by appropriate definition, which is to serve as a basis of comparison or measurement for other quantities of the same nature.

Valence of an atom of an element is that property which is measured by the number of atoms of hydrogen (or its equivalent) one atom of that element can hold in combination if negative, or can displace in a reaction if it is positive.

Valence electrons of the atom are electrons which are gained, lost or shared in chemical reactions.

Van der Waals' equation of state.—This equation is expressed by:

$$\left(p + \frac{a}{v^2}\right)(v - b) = RT$$

It makes allowance both for the volume occupied by the molecules and for the attractive force between the molecules. b is the effective volume of molecules in one mole of gas. a is a measure of the attractive force between the molecules. For values of R, a, and b see index for table of Van der Waal's constants for gasses.

Van't Hoff's principle.—If the temperature of interacting substances in equilibrium is raised, the equilibrium concentrations of the reaction are changed so that the products of that reaction which absorb heat are increased in quantity, or if the temperature for such an equilibrium is lowered, the products which evolve heat in their formation are increased in amounts.

Vapor. The words **vapor** and **gas** are often used interchangeably. **Vapor** is more frequently used for a substance which, though present in the gaseous phase, generally exists as a liquid or solid at room temperature. **Gas** is more frequently used for a substance that generally exists in the gaseous phase at room temperature. Thus one would speak of iodine or carbon tetrachloride vapors and of oxygen gas.

Vapor pressure.—The pressure exerted when a solid or liquid is in equilibrium with its own vapor. The vapor pressure is a function of the substance and of the temperature.

Vectors, composition of.—If the angle between two vectors is A, and their magnitude a and b, their resultant,

$$C = \sqrt{a^2 + b^2 + 2ab \cos A}.$$

Velocity.—Time rate of motion in a fixed direction. Cgs units,—one centimeter per second. Dimensions,—$[l\ t^{-1}]$.

If s is space passed over in time t, the velocity,

$$v = \frac{s}{t}$$

Velocity of a compressional wave.—The velocity of a compressional wave in an elastic medium, in terms of elasticity E (bulk modulus) and density d,

$$V = \sqrt{\frac{E}{d}}$$

For the velocity of sound in air, where p is the pressure and d the density,

$$V = \sqrt{\frac{1.4p}{d}}$$

Velocity of efflux of a liquid.—If h is the distance from the opening to the free surface of the liquid, the velocity of efflux is

$$V = \sqrt{2gh}$$

The above is the theoretical discharge velocity disregarding friction and the shape of orifice. For water issuing through a circular opening with sharp edges of area, A, the volume discharged per second is given approximately by,

$$Q = 0.62A\ \sqrt{2gh}$$

Velocity of sound, variation with temperature.—The velocity in meters per sec at any temperature t in °C is given approximately by

$$V = V_o \sqrt{1 + \frac{t}{273}}$$

$$V = 331.5 + .607t$$

The **variation with humidity** is given by the equation

$$V_d = V_h \sqrt{1 - \frac{e}{p}\left(\frac{\gamma_\omega}{\gamma_a} - \frac{5}{8}\right)}$$

where V_d is the velocity in dry air, V_h that in air at barometric pressure p in which the pressure of water vapor is e. γ_ω and γ_a are the specific heat ratios for water vapor and for air respectively.

Velocity of a transverse wave in a stretched cord. If T is the tension of the cord and m the mass per unit length,

$$V = \sqrt{\frac{T}{m}}$$

Velocity of water waves.—If the depth h is small compared with the wave length, the velocity,

$$V = \sqrt{gh}$$

In deep water for a wave length λ,

$$V = \sqrt{\frac{g\lambda}{2\pi}}$$

If the wavelength is very small, less than about 1.6 cm, the velocity increases as the wave length decreases and is expressed by the following,

$$V = \sqrt{\frac{2\pi T}{\lambda d} + \frac{g\lambda}{2\pi}}$$

where T is the surface tension and d the density of the liquid V will be given in cm per sec if h and λ are in cm, g in cm per sec^2, T in dynes per cm and d in g per cm^3.

Velocity of a wave.—The velocity of propagation in terms of wavelength λ and the period T or frequency n is,

$$V = \frac{\lambda}{T} = n\lambda$$

Viscosity.—All fluids possess a definite resistance to change of form and many solids show a gradual yielding to forces tending to change their form. This property, a sort of internal friction, is called viscosity; it is expressed in dyne-seconds per cm² or poises. Dimensions,—$[m\,l^{-1}\,t^{-1}]$. If the tangential force per unit area, exerted by a layer of fluid upon one adjacent is one dyne for a space rate of variation of the tangential velocity of unity, the viscosity is one poise.

Kinematic viscosity is the ratio of viscosity to density. The c. g. s. unit of kinematic viscosity is the **stoke.**

Flow of liquids through a tube; where l is the length of the tube, r its radius, p the difference of pressure at the ends, η the coefficient of viscosity, the volume escaping per second,

$$v = \frac{\pi p r^4}{8 l \eta} \text{ (Poiseuille).}$$

The volume will be given in cm³ per second if l and r are in cm, p in dynes per cm² and η in poises per dyne-seconds per cm².

Visibility is measured by the ratio of the luminous flux in lumens to the total radiant energy in ergs per second or in watts.

Volt.—The unit of electromotive force. It is the difference in potential required to make a current of one ampere flow through a resistance of one ohm.

Volume, unit of.—The cubic centimeter, the volume of a cube whose edges are one centimeter in length. Other units of volume are derived in a similar manner. Dimension,—$[l^3]$.

Wave motion.—A progressive disturbance propagated in a medium by the periodic vibration of the particles of the medium. Transverse wave motion is that in which the vibration of the particles is perpendicular to the direction of propagation. Longitudinal wave motion is that in which the vibration of the particles is parallel to the direction of propagation.

Weight.—The force with which a body is attracted toward the earth. Cgs unit,—the dyne. Dimensions,—$[m\,l\,t^{-2}]$.

Although the weight of a body varies with its location, the weights of various standards of mass are often used as units of force as,—pound weight, or pound force, gram weight, etc. The weight of mass m, where g is the acceleration due to gravity,

$$W = mg.$$

The weight will be given in dynes when m is in grams and g in cm per sec².

Wheatstone's bridge.—If the resistances r_1, r_2, r_3, and r_4 form the arms of a Wheatstone's bridge in order as the circuit (omitting cell and galvanometer connections) is traced, when the bridge is balanced,

$$\frac{r_1}{r_2} = \frac{r_4}{r_3} \quad \text{or} \quad \frac{r_1}{r_4} = \frac{r_2}{r_3}$$

Wien's displacement law.—When the temperature of a radiating black body increases, the wave length corresponding to maximum energy decreases in such a way that the product of the absolute temperature and wave length is constant.

$$\lambda_{max} T = w$$

w is known as **Wien's displacement constant.**

Work.—When a force acts against resistance to produce motion in a body the force is said to do work. Work is measured by the product of the force acting and the distance moved through against the resistance. Cgs units of work,—the erg, a force of one dyne acting through a distance of one centimeter. The joule is 1×10^7 ergs. Dimensions,—$[m\, l^2\, t^{-2}]$. The foot-pound is the work required to raise a mass of one pound a vertical distance of one foot where $g = 32.174$ ft./sec². The foot-poundal is the work done by a force of one poundal acting through a distance of one foot. The International joule, a unit of electrical energy, is the work expended per second by a current of one International ampere flowing through one International ohm. The kilowatt-hour is the total amount of energy developed in one hour by a power of one kilowatt.

If a force F act through a space s, the work done is

$$W = Fs$$

Work will be given in ergs if F is in dynes and s in cm.

Work done in rotation. If a torque L dyne-cm acts through an angle θ radians, the work done in ergs is

$$W = L\theta$$

X-rays.—A type of radiation of higher frequency than visible light but lower than gamma rays. Usually produced by high energy electrons impinging upon a metal target.

Zeeman effect.—The splitting of a spectrum line into several symmetrically disposed components, which occurs when the source of light is placed in a strong magnetic field. The components are polarized, the directions of polarization and the appearance of the effect depending on the direction from which the source is viewed relative to the lines of force.

MEASURES AND UNITS

FUNDAMENTAL STANDARDS

The primary standard of **length** is defined as the distance between two lines at 0° C on a platinum-iridium bar known as the **International Prototype Meter** deposited at the International Bureau of Weights and Measures. The International Prototype Meter is 1553164.13 times the wave length of the red cadmium line in air, 760 mm pressure, 15° C

The primary standard of **mass** is defined as the mass of the **International Prototype Kilogram** of platinum-iridium kept at the International Bureau of Weights and Measures at Sèvres. It is equal to the mass of 0.001000027 cubic meter of pure water at 4° C and 760 mm pressure.

The primary standard of **capacity** is the **liter** which is the volume of one kilogram of pure water at the temperature of maximum density and under normal atmospheric pressure.

The primary standard of **time** is the **mean solar second,** one eighty six thousand four hundredth ($\frac{1}{86400}$) part of a mean solar day.

The standard scale of **temperature** adopted by the International Committee of Weights and Measures 1887 is based on the variations in pressure of hydrogen at constant volume. The hydrogen is taken at an initial pressure, at the temperature of melting ice, of one meter of mercury (0° C, sea level, latitude 45°). The scale is defined by taking the temperature of melting ice as 0° and that of condensing steam under 760 mm pressure as 100°. This is known as the Centigrade (C) scale.

The **absolute** or **thermodynamic temperature scale** proposed by Lord Kelvin is based on the average kinetic energy per molecule of a perfect gas. The temperature of melting ice is 273.18° and that of the boiling point of water 373.18°. This is frequently referred to as the Kelvin (K) scale.

International Electrical Units

Adopted in the United States January 1, 1948

1 international ohm = 1.000495 absolute ohms
1 international volt = 1.00033 absolute volts
1 international ampere = 0.999835 absolute ampere
1 international coulomb = 0.999835 absolute coulomb
1 international henry = 1.000495 absolute henries
1 international farad = 0.999505 absolute farad
1 international watt = 1.000165 absolute watts
1 international joule = 1.000165 absolute joules

1 mil = 0.001 inch = 25.4001 microns = .0254001 millimeter.
1 hand = 4 inches = 10.1600 centimeters.
1 span = 9 inches = 22.86005 centimeters.
1 fathom (fath.) = 6 feet = 1.828804 meters.
1 link (li.) = 0.66 foot = 7.92 inches = 20.11684 centimeters.
1 rod (rd.) = 25 links = 5.029210 meters
1 surveyor's or Gunter's chain (ch.) = 4 rods = 100 links = 66 feet = 20.11684 meters.
1 engineer's or Ramsden's chain = 100 links of one foot each = 100 feet = 30.4801 meters.
International nautical mile = 1.152 statute miles = 1,852 meters = 6,076.10333 feet of arc on the Earth's surface at the equator.
1 British yard = 3 feet = 36 inches = 0.914399 meter.
1 British inch = 2.539998 centimeters.
1 British mile = 1,760 yards = 1.60934 kilometers.
1 furlong (fur.) = 40 rods = 220 yards = 660 feet = 201.168 meters.
1 pole (British) = 5.5 yards = 5.0292 meters = approximately 1 rod.
1 British fathom = 6.00 feet.
1 toise = 6 Paris feet = 1.94904 meters.
1 Paris foot (pied) = 12 Paris inches = 0.324839 meter.
1 Paris inch (pouce) = 12 Paris lines = 2.70700 centimeters.
1 Paris line (ligne) = 0.225583 centimeter.
1 light year = 5.9×10^{12} miles = 9.5×10^{12} kilometers.
1 point (type sizes) = $\frac{1}{72}$ or 0.01389 inch.
1 line = $\frac{1}{12}$ or 0.083333 inch.
1 cubit = 18 inches.

1 British cubic yard = 27 cubic feet = 0.764553 cubic meter.
1 cubic foot = 6.229 British gallons = 7.481 U. S. gallons.
1 cubic yard = 168.17 British gallons.

WEIGHTS AND MEASURES (Continued)

U. S. System (Continued)

CAPACITY—LIQUID MEASURE

Gills (gi.)	Pints (pt.)	Quarts (qt.)	Gallons (gal.)	Cubic inches	Metric equivalent
1	0.25	0.125	0.03125	7.21875	118.292 milliliters
4	1	.5	.125	28.875	0.473167 liter
8	2	1	.25	57.749	0.946333 liter
32	8	4	1	231	3.785332 liters

1 gill = 4 fluid ounces = 1.18292 deciliters.
1 gallon (U. S.) of water at 15° weighs about 8.337 pounds avoirdupois or 3.7820 kilograms = 0.83268 British gallon.
1 hogshead = 63 gallons.
1 firkin = 9 gallons = 34.06799 liters.
1 tun = 252 gallons.
1 British gill = 1.4206 deciliters.
1 British pint = 4 gills = 0.56825 liter.
1 British quart = 2 pints = 1.13650 liters.
1 British gallon = 4 quarts = 277.420 cubic inches = 0.16054 cubic foot = 4.5459631 liters.
1 British gallon of water at 15° C weighs 10 pounds = 1.20094 U. S. gallons.

APOTHECARIES' FLUID MEASURE

Minims (min. or ♏)	Fluid drams (fl. dr. or ʒ)	Fluid ounces (fl. oz. or ℥)	Pints (pt.)	Metric equivalent
1	0.016667	0.0020833	......	0.0616102 milliliter
60	1	.125	......	3.69661 milliliters
480	8	1	0.0625	29.5729 milliliters
7,680	128	16	1	0.473167 liter

1 fluid ounce = 1.80469 cubic inches.
1 gallon = 128 fluid ounces = 8 pints.
1 British Imperial gallon = 8 pints = 160 fluid ounces = 4.5459631 liters.
1 British fluid ounce = 8 drachms = 28.4130 cubic centimeters.
1 British fluid drachm = 60 minims = 3.5515 cubic centimeters.
1 British minim = 0.059194 cubic centimeter.

DRY MEASURE

Pints (pt.)	Quarts (qt.)	Pecks (pk.)	Bushels (bu.)	Cubic inches	Metric equivalent
1	0.5	0.0625	0.015625	33.6003	0.550599 liter
2	1	.125	.03125	67.2006	1.101198 liters
16	8	1	.25	537.605	8.80958 liters
64	32	4	1	2,150.42	35.2383 liters

1 British peck = 2 British gallons = 554.6 cubic inches = 9.09193 liters.
1 British bushel = 8 British gallons = 2,219.3 cubic inches = 36.3677 liters = 1.03205 U. S. bushels.
1 British quarter = 8 bushels = 2.909 hectoliters.
1 U. S. bushel = 0.96895 British bushel.

WEIGHTS AND MEASURES (Continued)

U. S. System (Continued)

MASS

Note: Three systems are in use,—avoirdupois, troy and apothecaries'. The grain is the same in all.

AVOIRDUPOIS—COMMERCIAL

The U. S. Standard pound avoirdupois is defined as 453.5924277 grams.

Grains (gr.)	Drams (dr. av.)	Ounces (oz. av.)	Pounds (lb. av.)	Tons (short) (tn.)	Metric equivalent
1	0.03657143	....	....	......	0.064798918 g
27.34375	1	0.0625	....	......	1.771845 g
437.5	16	1	0.0625	......	28.349527 g
7,000	256	16	1	0.0005	453.5924 g 0.4535924 kg
....	....	32,000	2,000	1	907.18486 kg

1 pound avoirdupois is the mass of 27.692 cubic inches of water weighed in air at 4° C, 760 mm pressure.
1 short hundredweight (cwt.) = 100 pounds = 45.359243 kilograms.
1 short ton = 20 short hundredweight = 2,430.56 troy pounds = 907.18486 kilograms.
1 stone (British) = 14 pounds = 6.350 kilograms.
1 quarter (British) = 28 pounds = 12.70 kilograms.
1 long hundredweight (British) = 4 quarters = 112 pounds = 50.802352 kilograms.
1 long ton (British) = 20 long hundredweight = 1,016.04704 kilograms.
1 long ton = 1.12000 short tons = 2,722.22 troy pounds = 1.01605 metric tons.
1 short ton = 0.892857 long ton = 29,166.66 troy or apothecaries' ounces = 0.907185 metric ton.
1 avoirdupois pound = 1.21528 troy or apothecaries' pounds = 14.5833 troy ounces.
1 avoirdupois ounce = 0.911458 troy or apothecaries' ounce.

TROY WEIGHT

Grains (gr.)	Pennyweights (dwt.)	Ounces (oz. t.)	Pounds (lb. t.)	Metric equivalent
1	0.041667	0.0020833	....	64.798918 mg 0.064798918 g
24	1	.05	0.0041667	1.555174 g
480	20	1	.083333	31.103481 g
5,760	240	12	1	373.24177 g

1 troy pound = 5,760/7,000 or 0.822857 avoirdupois pound = 13.1657 avoirdupois ounces.
1 carat (1877) = 3.168 grains = 205.6 milligrams.
1 troy ounce = 1.09714 avoirdupois ounces.
1 troy pound = 0.00036735 long ton = 0.00041143 short ton = 0.00037324 metric ton.

WEIGHTS AND MEASURES (Continued)

U. S. System (Continued)

APOTHECARIES' WEIGHT

Grains (gr.)	Scruples (℈ or s. ap.)	Drams (ʒ or dr ap.)	Ounces (℥ or oz. ap.)	Pounds (lb. ap.)	Metric equivalent
1	0.05	0.016667	0.0020833	....	64.798918 mg
20	1	.33333	.041667	0.0034722	1.2959784 g
60	3	1	.125	.0104167	3.8879351 g
480	24	8	1	.083333	31.103481 g
5,760	288	96	12	1	373.24177 g

TIME

Seconds (sec.)	Minutes (min.)	Hours (hr.)	Days (da.)	Years (yr.)
1	0.0166667	0.000277778		
60	1	.0166667	0.000694446	
3,600	60	1	.0416667	
86,400	1,440	24	1	
......	....	....	365.2422	1 (common)
......	....	....	365.256	1 (sidereal)

1 lunar month (mo.) = 29 days 12 hours 44 minutes.
1 sidereal second = 0.997270 mean solar second.

ANGLE

Seconds (″)	Minutes (′)	Degrees (°)	Circumference	Radians
1	0.0166667	0.000277778	0.00000771605	0.00000484814
60	1	.0166667	.0000462963	.000290888
3,600	60	1	.00277778	.0174533
1,296,000	21,600	360	1	6.28319
206,265	3,437.75	57.2958	0.159155	1

1 radian = 57° 17′ 44.8″ = $1/2\pi$ of a circumference.
2π radians = 360° = 1 circumference.
π radians = 180°.
$\pi/2$ radians = 90°.
$\pi/4$ radians = 45°.
1 grade = $\frac{1}{400}$ circumference = 100 centesimal minutes = 0.0157079 radian.
1 centesimal minute = 100″ centesimal seconds.

SOLID ANGLE

1 steradian = $1/4\pi$ of the solid angle around a point.

UNITS AND CONVERSION FACTORS

Each unit named is followed by its equivalent in one or more other units of the same quantity. While the list of equivalents is incomplete it is intended to include all those which will be in common use

Symbols in the dimensional formulae given after the headings have the following significance: m, mass, l, length; t, time; θ, temperature; ϵ, dielectric constant of a vacuum; μ, permeability of a vacuum.

Mass, Length, Time, Angle, Area and Volume

Acre (A.) (U. S.).—0 0015625 square mile, 10 square chains (Gunter's), 160 square rods or square perches; 4840 square yards; 4.3560×10^4 square feet, 1×10^5 square links (Gunter's), 0.4046873 hectare or square hectometer, 40 46873 ares or square dekameters; 4046.873 square meters

Acre (A.) (British).—4 roods (British), 4840 square yards (British), 0.4046849 hectare or square hectometer, 4046 849 square meters

Ångstrom Unit (Å. or Å. U.).—3.937×10^{-9} inch, 0.003937 millionths of an inch, 1×10^{-10} meter, 1×10^{-8} centimeter, 1×10^{-4} micron (μ); 0.1 milli-micron or micro-millimeter; 100 millionth microns or micro-microns ($\mu\mu$)

Are (a).—3.8610×10^{-5} square mile, 0.02471044 acre (U. S.): 119 60 square yards; 1076.4 square feet, 0.01 hectare, 1 square dekameter, 100 square meters

Astronomical unit.—$1\ 495\times10^8$ kilometers

Bag (British).—3 bushels (dry), 0 109107 cubic meter

Barleycorn (British).—1/3 inch, 0.84667 centimeter

Barrel (bbl.) (U. S., dry).—3.281 bushels, 105.0 quarts (dry); 7056 cubic inches for dry commodities except cranberry barrel which=5826 cubic inches; 0 11562 cubic meter

Barrel (bbl.) (U. S., liquid).—31.5 gallons, 0 11924 cubic meter; 42 gallons (oil)

Barrel (bbl.) (British, dry).—36 gallons (British), 0 16366 cubic meter

Board Foot (bd. ft.).—1/12 cubic foot, 144 cubic inches (1 foot×1 foot×1 inch); 2359.8 cubic centimeters

Bolt (U. S., cloth.).—120 linear feet; 36.576 meters.

Bucket (British, dry).—4 gallons (British); 1.8184×10^4 cubic centimeters.

Bushel (bu.) (U. S., dry).—0.304785 barrel; 0.96895 bushel (British); 1 2444 cubic feet, 4 pecks, 32 quarts (dry); 64 pints (dry); 2150 42 cubic inches; 0.035239 cubic meter; 0.35238 hectoliter, 3.5238 dekaliters; 35 238 liters; 3.5239×10⁴ cubic centimeters.

Bushel (bu.) (British, dry).—⅛ or 0.125 quarter (British, capacity); 1/3 or 0.33333 bag (British); 1.03205 bushels (U S); 1 2843 cubic feet; 8 gallons (British); 2219.3 cubic inches; 0.363677 hectoliter, 3 63677 dekaliters; 36.3677 liters; 3 6369×10⁴ cubic centimeters

Butt (British, dry).—126 gallons; 0.57281 cubic meter.

Cable Length (British & U S.).—720 feet; 219.46 meters.

Carat (c) (metric)—3.08647 grains; 0.2 gram; 200 milligrams

Carat (c) (1877).—3 168 grains, 205.6 milligrams.

Cental—100 pounds, 45.359 kilograms.

Centare (ca).—1 196 square yards, 10 764 square feet; 1550 square inches; 0.01 are, 1 square meter

Centigram (cg).—0 1543236 grain; 0.01 gram.

Centiliter (cl).—0.33815 ounce (fluid, U. S.); 0.61025 cubic inch; 2.705179 drams (fluid, U S.); 0.01 liter; 10.00027 cubic centimeters.

Centimeter (cm).—0 01093611 yard (U. S.); 0.01093614 yard (British); 0.032808 foot (U S or British); 0.39370 inch (U S. or British), 4.4330 lignes (Paris lines); 393.70 mils; 0.01 meter; 10 millimeters; 1×10⁴ microns; 1×10⁷ milli-microns or micro-millimeters; 1×10⁸ Ångström units.

Chain (ch.) (Engineer's or Ramden's).—100 feet; 100 links of 1 foot each; 30 4801 meters

Chain (ch.) (Surveyor's or Gunter's).—0.1 furlong; 0.0125 mile, 4 rods; 22 yards; 66 feet, 100 links, 792 inches; 20.117 meters, 2011 7 centimeters

Chaldron (U S., dry)—*36 bushels (U S); 1.2686 cubic meters

Chaldron (British, dry).—*32 bushels (British); 1 1638 cubic meters

Circle (cir)—2π or 6 2832 radians, 12 signs; 360 degrees

Circular Inch.—Area of circle, diameter of which is one inch: 0 78540 square inch, 5.0671 square centimeters.

Circular Mil.—Area of circle, diameter of which is one mil or 1/1000 inch; 7.854×10^{-7} square inch; 0.78540 square mil; 5.0671×10^{-6} square centimeter; 5.0671×10^{-4} square millimeter.

---

*Variable.

Circular Millimeter.—0.0078540 square centimeter; 0.78540 square millimeter.

Circumference.—2π or 6.28319 radians; 360 degrees; 400 grades; 2.1600×10^{4} minutes; 1.296000×10^{6} seconds.

Clove or Customary Stone (British).—8 pounds; 3.6287 kilograms.

Coomb (British, dry).—4 bushels; 0.14548 cubic meter.

Cord (cd.).—8 cord feet; 128 cubic feet (8 feet×4 feet×4 feet); 3.625 cubic meters.

Cord-Foot (cd. ft.)—⅛ or 0.125 cord; 16 cubic feet (4 feet × 4 feet × 1 foot).

Cubic Centimeter (cm^3).—1.3079×10^{-6} cubic yard; 2.7496×10^{-5} bushel (British); 2.83776×10^{-5} bushel (U. S.); 3.531445×10^{-5} cubic foot (U. S.); 3.531477×10^{-5} cubic foot (British); 2.1997×10^{-4} gallon (British); 2.6417×10^{-4} gallon (U. S.); 4.2376×10^{-4} board foot; 8.7988×10^{-4} quart (liquid, British), 9.0808×10^{-4} quart (dry, U. S.); 0.0010567 quart (liquid, U. S.); 0.0018162 pint (dry, U. S.); 0.0021134 pint (liquid, U. S.); 0.033814 ounce (fluid, U. S.); 0.035195 ounce (fluid, British); 0.061023 cubic inch; 0.27051 dram (fluid, U. S.); 0.28157 drachm (fluid, British); 16.231 minims (U. S.); 16.894 minims (British); 1×10^{-6} cubic meter; 9.9997×10^{-4} liter; 0.001 cubic decimeter; 0.99997 milliliter; 1000 cubic millimeters.

Cubic Decimeter (dm^3).—0.0013079 cubic yard; 0.035314 cubic foot; 61.023 cubic inches; 0.001 cubic meter; 0.99997 liter; 1000 cubic centimeters.

Cubic Dekameter (dkm^3).—1000 cubic meters.

Cubic Foot ($ft.^3$ or cu. ft.) (U. S.).—1/128 or 0.0078125 cord. 0.01 register ton (British); 1/27 or 0.037037 cubic yard; 1/16 or 0.0625 cord-foot; 0.77861 bushel (British); 0.80357 bushel (U. S.); 6.229 gallons (British); 7.481 gallons (U. S.); 12 board feet; 25.714 quarts (dry, U. S.); 29.922 quarts (liquid, U. S.); 59.844 pints (liquid, U. S.); 1728 cubic inches; 0.02831701 cubic meter; 28.316 liters; 2.8317×10^{4} cubic centimeters.

Cubic Foot ($ft.^3$ or cu. ft.) (British).—0.02831677 cubic meter; 2.831677×10^{4} cubic centimeters.

Cubic Inch ($in.^3$ or cu. in.) (U. S.).—2.143347×10^{-5} cubic yard; 4.65025×10^{-4} bushel (U. S.); 5.78704×10^{-4} cubic foot; 0.00186010 peck; 0.0043290 gallon (U. S.); 1/144 or 0.006944 board foot; 0.014881 quart (dry, U. S.); 0.017316 quart (liquid, U. S.); 0.0297616 pint (dry); 0.5541 ounce (fluid); 4.4329 drams (fluid); 1.6387162 × 10^{-5} cubic meter; 0.0163868 liter; 1.63868 centiliters; 16.3868 milliliters; 16.387162 cubic centimeters; 1.6387162 × 10^4 cubic millimeters.

Cubic Inch (in.^{3} or cu. in) (British).—4.5081 × 10^{-4} bushel (British); 5.7870 × 10^{-4} cubic foot (British); 0.0018031 peck (British); 0.003606 gallon (British); 16.3870253 cubic centimeters.

Cubic Hectometer (hm^3).—1 × 10^6 cubic meters.

Cubic Kilometer (km^3).—1 × 10^9 cubic meters.

Cubic Meter (m^3).—0.2759 cord; 1.3079428 cubic yards (U. S.); 1.307954 cubic yards (British); 28.3776 bushels (U. S.); 35.314445 cubic feet (U. S.); 35.31477 cubic feet (British); 264.173 gallons (U. S.); 1056.7 quarts (liquid); 2113.4 pints (liquid, U. S.); 6.1023 × 10^4 cubic inches; 1 stere; 999.973 liters; 1000 cubic decimeters; 1 × 10^6 cubic centimeters; 1 × 10^9 cubic millimeters.

Cubic Millimeter (mm^3).—6.1023 × 10^{-5} cubic inch; 0.01623 minim (U. S.); 0.01689 minim (British); 1 × 10^{-9} cubic meter; 0.001 cubic centimeter.

Cubic Yard (yd.^{3} or cu. yd.) (U. S.).—27 cubic feet; 168.17 gallons (British); 202.0 gallons (U. S.); 807.9 quarts (liquid, U. S.); 1616 pints (liquid, U. S.); 4.6656 × 10^4 cubic inches; 0.76455945 cubic meter; 764.54 liters; 7.6455945 × 10^5 cubic centimeters.

Cubic Yard (yd.^{3} or cu. yd.) (British).—27 cubic feet; 0.76455285 cubic meter.

Cubit.—18 inches; 45.72 centimeters.

Dalton.—1/16 the mass of an atom of oxygen; 1.650 × 10^{-24} gram.

Day (da) (tropical, mean solar).—24 hours (mean solar); 1440 minutes (mean solar); 8.6400 × 10^4 seconds (mean solar).

Day (da) (sidereal).—8.6164 × 10^4 seconds (mean solar).

Decigram (dg.).—1.543236 grains; 0.1 gram.

Deciliter (dl).—0.176 pint (British); 3.38147 ounces (fluid, U. S.); 0.1 liter; 100.0027 cubic centimeters.

Decimeter (dm).—0.3280833 foot (U. S.); 0.3280843 foot (British); 3.93700 inches (U. S.); 3.937011 inches (British); 0.1 meter.

Decistere (ds).—0.1 stere or cubic meter.

Degree (°).—1/360 or 0.0027778 circumference or revolution; 1/90 or 0.01111 quadrant; 0.017453 radian; 60 minutes; 3600 seconds.

Dekagram (dkg).—0.35273957 ounce (avoirdupois); 5.64383 drams (avoirdupois); 0.01 kilogram; 10 grams.

Dekaliter (dkl).—0.27497 bushel (British); 0.28378 bushel (U. S.); 1.13513 pecks (U. S.); 9.08102 quarts (U. S., dry); 18.162 pints (dry, U. S.); 10 liters; 10.00027 cubic decimeters.

Dekameter (dkm).—1.98838 rods (U. S.); 10.93611 yards (U. S.); 10.93614 yards (British); 393.70 inches; 10 meters.

Dekastere (dks).—10 steres or cubic meters.

Drachm (fluid) (dr. fl. or ʒ fl.) (British).—⅛ or 0.125 ounce (fluid, British); 60 minims; 3.5515 cubic centimeters.

Dram (apothecaries' or troy) (dr. ap. or t. or ʒ ap. or t.)—(Same as British Drachm)—0.008571429 pound (avoidrupois); 1/96 or 0.010416667 pound (apothecary or troy); ⅛ or 0.12500 ounce (apothecary or troy); 0.1371429 ounce (avoirdupois); 2.194286 drams (avoirdupois); 2.5 pennyweights; 3 scruples; 60 grains; 3.8879351 grams.

Dram (avoirdupois) (dr. av. or ʒ av.).—1/256 or 0.00390625 pound (avoirdupois); 0.0047471788 pound (apothecary or troy); 0.056966146 ounce (apothecary or troy); 0.0625 ounce (avoirdupois); 0.4557292 dram (apothecary or troy); 1.139323 pennyweights; 1.3671875 scruples; 27.34375 grains; 1.771845 grams; 1771.845 milligram.

Dram (fluid) (dr. fl. or ʒ fl.) (U.S.).—0.00390625 quart (liquid, U. S.); 0.0078125 pint (liquid, U. S.); 0.03125 gill (U. S.); ⅛ or 0.125 ounce (fluid); 0.225586 cubic inch; 60 minims; 3.6966 milliliters; 3.6967 cubic centimeters.

Ell.—45 inches; 114.30 centimeters.

Em, Pica (printing industry).—1/6 or 0.16667 inch; 0.42333 centimeter.

Fathom (fath.) (nautical).—6 feet, 1.828804 meter.

Firkin (fir.) (U. S.).—9 gallons (U. S.); 34.068 liters.

Firkin (fir.) (British).—9 gallons (British); 40.914 liters.

Fluid Ounce (fl. oz.)—See **Ounce (Fluid)**.

Foot (ft.) (U. S.)—1.6447 × 10^{-4} mile (nautical); 1.893939 × 10^{-4} mile (statute); 0.00151515 furlong; 0.0151515 chain (Gunter's); 0.0606061 rod; 1/6 or 0.16667 fathom; 1/3 or 0.33333 yard; 12 inches; 0.3048006 meter, 30.48006 centimeter; 473404 wave-lengths of red line of cadmium.

Foot (ft.) (British).—0.4 pace (British); 30.47997 centimeters.

Foot (Paris).—(See **Pied**).

Furlong (fur.) (U. S. or British).—⅛ or 0.125 mile (U. S.); 10 chains(Gunter's); 40 rods, 220 yards; 660 feet; 201.168 meters.

Gallon (gal.) (U.S.).—1 U. S. gallon of water at 62°F weighs 3.7820 kilograms or 8.337 pounds (avoirdupois); 0.004951 cubic yard; 0.031746 barrel (liquid, U. S.); 0.13368 cubic foot; 0.83268 gallons (British); 4 quarts (liquid); 8 pints (liquid); 32 gills; 128 ounces (fluid); 231.00 cubic inches; 6.1440 × 10^4 minims; 0.0037854 cubic meter; 3.7853 liters; 3785.4 cubic centimeters.

Gallon (gal.) (British Imperial) (Canadian).—1 British gallon of water at 62°F has a mass of 10 pounds (avoirdupois); 0.02778 barrel (dry, British), ⅛ or 0.125 bushel (dry, British); 0.16054 cubic foot; 0.5 peck (British); 1.20094 gallons (U. S.); 4 quarts (liquid, British); 8 pints (liquid, British); 32 gills (liquid, British); 160 ounces (fluid, British); 277.3 cubic inches; 4.54596 liters; 4546.1 cubic centimeters.

Geepound—**See Slug.**

Gill (gi.) (U. S.).—1/32 or 0.03125 gallon (U. S.); ⅛ or 0.125 quart (liquid, U. S.); ¼ or 0.25 pint (liquid, U. S.); 4 ounces (fluid); 7.21875 cubic inches; 32 drams (fluid); 1920 minims; 0.118292 liters; 118.295 cubic centimeters.

Gill (gi.) (British).—1/32 or 0.03125 gallon (British); ¼ or 0.25 pint (liquid, British); 5 ounces (fluid, British); 0.14206 liter; 142.07 cubic centimeters.

Grade—1/400 or 0.0025 circumference; 0.0157079 radian; 0.9 degree; 100 centesimal minutes.

Grain (gr.).—1/7000 or 1.42857 × 10^{-4} pound (avoirdupois); 1/5760 or 1.736111 × 10^{-4} pound (apothecary or troy); 0.0020833 ounce (apothecary or troy); 0.0022857 ounce (avoirdupois); 0.016667 dram (apothecary or troy); 0.03657143 dram (avoirdupois); 0.0416667 pennyweight (troy); 0.05000 scruple (apothecary); 0.064798918 gram; 0.3240 carat (metric); 64.798918 milligram.

Gram (g).—0.00220462 pound (avoirdupois); 0.00267923 pound (apothecary or troy); 0.0321507 ounce (apothecary or troy); 0.0352739 ounce (avoirdupois); 0.257206 dram (apothecary or troy); 0.564383 dram (avoirdupois); 0.6430149 pennyweight; 0.771618 scruple; 15.4324 grains; 1 × 10^{-6} ton (metric); 1 × 10^{-4} myriagram; 0.001 kilogram; 5 carats (metric); 1000 milligrams; 1 × 10^6 microgram.

Hand.—4 inches; 10.160 centimeters.

Hectare (ha)—2.471044 acres (U. S.); 2.471058 acres (British); 395.367 square rods (U. S.); 1.195985 × 10^4 square yards (U. S.); 1.0764 × 10^5 square feet; 100 ares; 1 × 10^4 square meters.

Hectogram (hg).—3.52739 ounces (avoirdupois); 100 grams.

Hectoliter (hl).—2.7497 bushels (British); 2.8378 bushels (U. S.); 11.3513 pecks (U. S.); 100 liters.

Hectometer (hm).—19.8838 rods; 109.3611 yards (U. S.); 109.3614 yards (British); 328.08 feet (U. S.); 100 meters.

Hemisphere.—0.5 sphere; 4 spherical right angles; 6.2832 steradians.

Hogshead (hhd.) (British).—63 gallons (British); 10.114 cubic feet; 0.28640 cubic meters.

Hogshead (hhd.) (U. S.).—63 gallons (U. S.); 8.4218 cubic feet; 0.23848 cubic meter.

Hour (hr.) (tropical, mean solar).—0.0059524 week; 0.041667 day (mean solar); 60 minutes (mean solar); 3600 seconds (mean solar).

Hundredweight (cwt.) (short).—100 pounds; 0.044643 ton (long); 0.05 ton (short); 4 quarters (British); 1600 ounces (avoirdupois); 0.0453592 ton (metric); 45.3592 kilograms.

Hundredweight (cwt.) (long).—112 pounds; 0.05 ton (long); 4 quarters (British); 50.8023 kilograms.

Inch (in.) (U. S.).—1.57828×10^{-5} mile; 0.00126263 chain (Gunter's); 0.00505051 rod; 1/36 or 0.027778 yard; 1/12 or 0.08333 foot; 0.126263 link (Gunter's); 72 points (printer's type); 1000 mils; 2.540005 centimeter; 25.40005 millimeters; 2.5400×10^{8} Ångström unit; 39450.33 wave lengths of red line of cadmium.

Inch (in.) (British).—1/36 or 0.027778 yard (British); 1/9 or 0.1111 quarter (British, linear); 2.539998 centimeters; 25.39998 millimeter.

Inch (Paris).—See **Pouce.**

Kilderkin (British).—18 gallons (British); 0.081830 cubic meter.

Kilogram (kg).—9.842064×10^{-4} ton (long); 0.0011023112 ton (short); 0.019684 hundredweight (long); 0.022046223 hundredweight (short); 0.07874 quarter (British); 2.2046223 pounds (avoirdupois); 2.6792285 pounds (apothecary or troy); 32.150742 ounces (apothecary or troy); 35.273957 ounces (avoirdupois); 257.21 dram (apothecary or troy); 564.38 dram (avoirdupois); 643.01 pennyweight; 771.62 scruples; 1.54324×10^{4} grains; 0.001 ton (metric); 1000 grams.

Kiloliter (kl). -1.3080 cubic yards; 35.316 cubic feet; 264.18 gallons (liquid, U. S.); 1.000027 cubic meters; 1000 liters.

Kilometer (km).—1.0567×10^{-13} light year; 0.53961 mile (nautical); 0.62137 mile (statute); 1093.6 yards; 3280.8 feet; 0.1 myriameter; 1000 meters; 1×10^{5} centimeters.

Knot as a unit of length.—1 nautical mile, which see. The knot is properly a unit of speed or velocity. See under that heading.

Last (**British**).—*80 bushels; 2.9095 cubic meters.

League (**statute**).—3 statute miles; 4.8280 kilometers.

League (**nautical**).—3 nautical miles; 5.5597 kilometers.

Light Year (**yr.**).—5.9×10^{12} miles; 9.4637×10^{12} kilometers.

Ligne (**Paris line**).—1/12 or 0.083333 pouce or Paris inch; 0.225583 centimeter.

Line (**British**) (obsolete)—1/12 or 0.08333 inch; 0.21167 centimeters.

Link (**li.**) (**Engineer's or Ramden's**).—0.01 chain (Engineer's); 1 foot; 12 inches; 30.480 centimeter.

Link (**li.**) (**Surveyor's or Gunter's**).—1.2500×10^{-4} mile 0.01 chain (Gunter's); 0.04 rod; 0.22 yards; 0.66 foot; 7.92 inches; 0.2011684 meter; 20.11684 centimeters.

Liter (**l**).—0.0013080 cubic yard; 0.027497 bushel (British); 0.028378 bushel (U. S.); 0.21998 gallon (British); 0.26417762 gallon (U. S.); 0.035316 cubic foot; 0.10999 peck (British); 0.11351 peck (U. S.); 0.87990 quart (British); 0.908102 quart (dry, U. S.); 1.056710 quarts (liquid, U. S.); 1.7598 pints (British); 1.8162 pints (dry, U. S.); 2.1134 pints (liquid, U. S.); 7.0392 gills (British); 8.4538 gills (U. S.); 33.8147 ounces (fluid, U. S.); 35.196 ounces (fluid, British); 61.025 cubic inches; 270.5179 drams (fluid, U. S.); 0.001000027 cubic meter; 1.000027 cubic decimeter; 1000.027 cubic centimeter.

Megameter.—1×10^{6} meter.

Meter (**m**).—5.3961×10^{-4} mile (nautical); 6.2137×10^{-4} mile (statute); 0.00497096 furlong; 0.0497096 chain (Gunter's); 0.198838 rod (U. S.); 0.54681 fathom; 1.093611 yards (U. S.); 1.093614 yards (British); 3.0784 pied (French foot); 3.280833 feet (U. S.); 3.280843 feet (British); 4.970960 links (Gunter's); 39.3700 inches (U. S.); 39.3701 inches (British); 1×10^{-6} megameter; 0.001 kilometer; 100 centimeters; 1×10^{9} milli-microns or micro-millimeters; 1×10^{10} Angstrom unit; 1×10^{12} millionth microns ($\mu\mu$) 1.55316413×10^{6} wave-lengths of red line of cadmium.

Metric carat (**c**) See **Carat** (**metric**).

Metric Ton (**t**) See **Tonne.**

Microgram (μ**g or** γ).—1×10^{-6} gram; 0.001 milligram.

---

*Variable.

Microliter (μl or λ).—1×10^{-6} liter.

Micromicron ($\mu\mu$).)—1×10^{-12} meter.

Micron (μ).—3.937×10^{-5} inch; 0.039370 mil; 39.37 millionths of an inch; 1×10^{-6} meter; 1×10^{-4} centimeter; 0.001 millimeter; 1000 milli-microns or micro-millimeters; 1×10^{4} Ångström units.

Mil.—0.001 inch; 0.00254001 centimeter; 0.0254001 millimeter; 25.4001 microns.

Mile (mi.) (U. S., statute).—1.69×10^{-13} light year; 0.86836 mile (nautical); 8 furlongs; 80 chains (Gunter's); 320 rods; 1760 yards; 5280 feet; 8000 links (Gunter's); 6.3360×10^{4} inches; 0.160935 myriameters; 1.60935 kilometers; 1609.35 meters.

Mile (mi.) (British).—1.60934 kilometers.

International nautical mile = 1.151 statute miles = 1,852 meters = 6,076.10333 feet.

Millier (t) See **Tonne.**

Milligram (mg). — 2.2046×10^{-6} pound (avoirdupois); 2.67923×10^{-6} pound (apothecary or troy); 3.215074×10^{-5} ounce (apothecary or troy); 3.52739×10^{-5} ounce (avoirdupois); 2.57206×10^{-4} dram (apothecary or troy); 5.64383×10^{-4} dram (avoirdupois); 6.43015×10^{-4} pennyweight; 7.71618×10^{-4} scruple; 0.01543236 grain; 1×10^{-6} kilogram; 0.001 gram; 0.005 carat (metric).

Milliliter (ml).—0.0084538 gill (U. S.); 0.0338147 ounce (fluid, U. S.); 0.035196 ounce (fluid, British); 0.061025 cubic inch; 0.2705179 dram (fluid, U. S.); 16.2311 minims (U. S.); 0.001 liter; 1.000027 cubic centimeter.

Millimeter (mm).—0.0393700 inch (U. S.); 0.0393701 inch (British); 39.37 mils; 0.001 meter; 0.1 centimeter; 1000 microns.

Milli-Micron or Micro-Millimeter (mμ).—1×10^{-9} meter; 1×10^{-7} centimeter; 0.001 micron; 10 Ångström units.

Millionth Micron or Micro-Micron ($\mu\mu$).—1×10^{-12} meter; 1×10^{-10} centimeter; 0.01 Ångström units.

Minim (min. or ♍) (British).—0.059194 cubic centimeter.

Minim (min. or ♍) (fluid, U. S.).—1/61440 or 1.6276×10^{-5} gallon (U. S.); 1.3021×10^{-4} pint (liquid, U. S.); 5.2083×10^{-4} gill (U. S.); 1/480 or 0.0020833 ounce (fluid, U. S.); 1/60 or 0.016667 dram (fluid, U. S.); 0.061610 milliliter; 0.061612 cubic centimeter; 61.612 cubic millimeter.

Minute (′) (angle).—1.8519×10^{-4} quadrant; 2.90888×10^{-4} radian; 1/60 or 0.016667 degree; 60 seconds.

Minute (min.) (time).—9.9206×10^{-5} week; 6.94446×10^{-4} day; 0.016667 hour; 60 seconds.

Month (mo.) (mean calendar).—30.42 days; 730 hours; 4.3800×10^{4} minutes; 2.628×10^{6} seconds.

Month (mo.) (lunar).—29 days 12 hours 44 minutes.

Myriagram (Mg).—22.04622 pounds (avoirdupois); 10 kilograms; 1×10^{4} grams.

Myriameter (Mm).—6.21372 miles; 10 kilometers; 1×10^{4} meters.

Nail (British).—2.25 inch; 5.715 centimeters.

Noggin (British).—1/32 or 0.03125 gallon (liquid); 142.06 cubic centimeters.

Ounce (Fluid) (oz. fl. or ℥ fl.) (U. S.).—1/128 or 0.0078125 gallon (U. S.); 0.03125 quart (liquid, U. S.); 1/16 or 0.0625 pint (liquid); ¼ or 0.25 gill (U. S.); 1.80469 cubic inches; 8 drams (fluid); 480 minims; 0.0295729 liter; 0.295729 deciliter; 29.5729 milliliters; 29.5737 cubic centimeters.

Ounce (fluid) (oz. fl. or ℥ fl.) (British).—0.006250 gallon (British); 8 drachms (fluid, British); 480 minims; 28.4130 cubic centimeters.

Ounce (avoirdupois) (oz. av. or ℥ av.).—2.790179×10^{-5} ton (long); 3.125×10^{-5} ton (short); 6.25×10^{-4} hundredweight (short); 1/16 or 0.062500 pound (avoirdupois); 0.075954861 pound (apothecary or troy); 0.9114583 ounce (apothecary or troy); 7.29166 drams (apothecary or troy); 16 drams (avoirdupois); 18.22917 pennyweights; 21.875 scruples (apothecary); 437.5 grains; 2.83495×10^{-5} ton (metric); 28.349527 grams.

Ounce (apothecary or troy) (oz. ap. or t. or ℥ ap. or t.).—3.4285×10^{-5} ton (short); 0.06857143 pound (avoirdupois); 0.08333 pound (apothecary or troy); 1.09714 ounces (avoirdupois); 8 drams (apothecary or troy); 17.55428 drams (avoirdupois); 20 pennyweights (troy); 24 scruples; 480 grains; 31.103481 grams; 3.1103481×10^{4} milligrams.

Pace.—2½ feet; 30 inches (British); 76.2 centimeters.

Palm (British).—3 inches; 7.62 centimeters.

Parsec.—19×10^{12} miles; 3.084×10^{13} kilometers.

Peck (pk.) (U. S.).—¼ or 0.25 bushel; 8 quarts; 16 pints; 537.605 cubic inches; 0.880958 dekaliter; 8.80958 liters.

Peck (pk.) (British).—2 gallons (British); 554.6 cubic inches; 9.0919 liters.

Pennyweight (dwt.) (troy).—0.003428571 pound (avoirdupois); 0.0041667 pound (apothecary or troy); 1/20 or 0.05

ounce (apothecary or troy); 0.0548571 ounce (avoirdupois); 0.8777143 dram (avoirdupois); 24 grains; 1.55517 grams; 1555.17 milligrams.

Perch (British & U. S.).—1 rod; 16.5 feet; 5.0292 meters.

Perch (masonry).—24.75 cubic feet.

Pied (French foot).—1/6 or 0.16667 toise (French); 12 Paris inches; 0.3248 meter.

Pint (pt.) (dry, U. S.).—1/64 or 0.015625 bushel; 0.0625 peck; 0.5 quart; 33.600 cubic inches; 0.550599 liter; 550.61 cubic centimeters.

Pint (pt.) (liquid, U. S.).—6.1881×10^{-4} cubic yard; 0.016711 cubic foot; 1/8 or 0.125 gallon (U. S.); 0.5 quart (U. S.); 0.83268 British pint; 4 gills (U. S.); 16 fluid ounces (U. S.); 28.875 cubic inches; 128 fluid drams; 7680 minims; 0.473167 liter; 473.167 milliliters; 473.179 cubic centimeters.

Pint (pt.) (liquid, British).—1/8 or 0.125 gallon (British); 0.5 quart (British); 1.20094 U. S. pints; 4 gills (British); 20 fluid ounces (British); 0.56825 liter; 568.25 milliliters; 568.26 cubic centimeters.

Point (printer's type).—1/72 or 0.01389 inch; 0.035278 centimeter.

Pole (British).—1 rod; 5.5 yards; 16.5 feet; 5.0292 meters.

Pottle (British).—1/2 gallon (liquid); 2.273 cubic decimeters.

Pouce (Paris inch).—1/12 or 0.083333 pied or Paris foot; 12 lignes or Paris lines; 2.70700 centimeters.

Pound (avoirdupois) (lb. av.) (U. S. or British).—Is the mass of 27.681 cubic inches of water weighed in air at 4° C, 760 mm pressure; 4.464286×10^{-4} ton (long); 5×10^{-4} ton (short); 0.0089286 hundredweight (long); 0.01 hundredweight (short); 1.2152778 pounds (apothecary or troy); 14.5833 ounces (apothecary or troy); 16 ounces (avoirdupois); 116.6667 drams (apothecary or troy); 256 drams (avoirdupois); 291.6667 pennyweights; 350.01 scruples; 7000 grains; 4.5359243×10^{-4} ton (metric); 0.4535924 kilogram; 453.5924 grams.

Pound (apothecary or troy) (lb. ap. or t.) (U. S. or British).—3.6735×10^{-4} ton (long); 4.1143×10^{-4} ton (short); 0.822857 pound (avoirdupois); 12 ounces (apothecary or troy); 13.165714 ounces (avoirdupois); 96 drams (apothecary or troy); 210.6514 drams (avoirdupois); 240 pennyweights; 288 scruples; 5760 grains; 3.7324×10^{-4} ton (metric); 0.3732418 kilogram; 373.2418 grams.

Puncheon (British).—70 gallons (British); 84 wine gallons; 0.31823 cubic meter.

Quadrant.—1.57080 radians; 90 degrees; 5400 minutes.

Quart (qt.) (U. S., dry).—1/32 or 0.03125 bushel; 0.038889 cubic foot; ⅛ or 0.125 peck; 2 pints (dry); 67.2006 cubic inches; 1.10120 liters; 1101.23 cubic centimeters.

Quart (qt.) (U. S., liquid).—0.033421 cubic foot; ¼ or 0.25 gallon; 2 pints (liquid); 8 gills; 32 ounces (fluid); 57.749 cubic inches; 256.00 drams (fluid); 0.946333 liter; 946.358 cubic centimeters.

Quart (qt.) (British, liquid).—¼ gallon (British); 2 pints (liquid, British); 1.13650 liters; 1136.52 cubic centimeters.

Quarter (U. S., mass).—¼ short ton or 500 pounds; 226.795 kilograms.

Quarter (U. S., mass).—¼ long ton or 560 pounds; 254.01 kilograms.

Quarter (British, capacity)—8 bushels; 2.909 hectoliters.

Quarter (British, linear).—1 span; ¼ yard; 9 inches; 22.860 centimeters.

Quarter (British, mass).—¼ short hundredweight or 25 pounds; 11.340 kilograms.

Quarter (British, mass).—¼ long hundredweight or 28 pounds; 12.70 kilograms.

Quartern (British, dry).—½ gallon; 2273.1 cubic centimeters.

Quartern (British, liquid).—1/32 gallon; 142.07 cubic centimeters.

Quintal (q) (metric).—1.96841 hundredweights (long); 220.46 pounds; 100 kilograms; 1×10^5 grams.

Quintal* (q) (U. S. or British).—100 or 112 pounds.

Quire.—25 sheets.

Radian.—$1/2\pi$ or 0.159155 circumference or revolution; 0.637 quadrant; 57.29578 degrees; 57° 17′ 44.8″; 3437.75 minutes; 2.06265×10^5 seconds.

Ream.—500 sheets.

Register Ton (British).—100 cubic feet; 2.8317 cubic meters.

Revolution.—4 quadrants; 2π or 6.2832 radians; 360 degrees.

Rod (rd.) (surveyor's measure).—0.003125 mile; 0.025 furlong; 0.25 chain (Gunter's); 1 perch; 5.5 yards; 16.5 feet; 25 links; 198 inches; 5.029210 meters.

Rod (rd.) (British, volume).—1000 cubic feet; 28.317 cubic meters.

---

*Variable.

Rood (British).—¼ or 0.25 acre; 40 square perches; 1210 square yards; 10.117 ares or square dekameters.

Rope (British).—20 feet; 6.0960 meters.

Sack (British).—3 bushels; 0.10911 cubic meter.

Scruples (apothecary) (s. ap. or ℈).—0.002857143 pound (avoirdupois); 0.003472222 pound (apothecary or troy); 0.041667 ounce (apothecary or troy); 0.0457143 ounce (avoirdupois); 1/3 or 0.33333 dram (apothecary or troy); 0.7314286 dram (avoirdupois); 0.833333 pennyweight; 20 grains; 1.2959784 grams; 1295.9784 milligrams.

Seam (British).—8 bushels; 0.29095 cubic meter.

Second (Angle) (″).—4.84814×10^{-6} radian; 2.7778×10^{-4} degree; 0.016667 minute.

Second (sec) (time, mean solar).—1.1574×10^{-5} day (mean solar); 1.1606×10^{-5} day (sidereal); 2.7778×10^{-4} hour (mean solar); 0.016667 minute (mean solar); 1.00273791 seconds (sidereal).

Second (sec) (time, sidereal).—0.997270 second (mean solar).

Sign (s).—30 degrees.

Skein.—360 feet; 109.73 meters.

Slug.—1 geepound; 32.174 pounds; 14.594 kilograms.

Space, Entire (solid angle).—4π or 12.5664 steradians.

Span.—⅛ fathom; 1 quarter (British, linear); 9 inches; 22.86005 centimeters.

Sphere (solid angle).—2 hemispheres; 4π or 12.5664 steradians.

Spherical Right Angle.—⅛ or 0.125 sphere; ¼ or 0.25 hemisphere; $\pi/2$ or 1.5708 steradians.

Square Centimeter (cm^2).—2.47104×10^{-7} square chain; 3.95367×10^{-6} square rod; 1.1960×10^{-4} square yard; 0.0010764 square foot; 0.00247104 square link; 0.15500 square inch; 1.5500×10^{5} square mils; 1.9735×10^{5} circular mils; 127.32 circular millimeters; 1×10^{-4} square meter; 0.01 square decimeter; 100 square millimeters.

Square Chain (sq. ch.) (Gunter's).—1.5625×10^{-4} square mile; 16 square rods; 484 square yards; 4356 square feet; 1×10^{4} square links; 6.27264×10^{5} square inches; 404.6873 square meters.

Square Decimeter (dm^2).—15.500 square inch; 0.01 square meter; 100 square centimeters.

Square Degree.—3.0462×10^{-4} steradian.

Square Dekameter (dkm^2).—0.02471044 acre (U. S.); 119.60 square yards; 1 are; 100 square meters.

Square Foot ($ft.^2$ or sq. ft.) (U. S.).—3.58701×10^{-8} square mile; 2.29568×10^{-5} acre; 2.29568×10^{-4} square chain; 0.00367309 square rod; 1/9 or 0.111111 square yard; 2.29568 square links; 144 square inches; 9.290341×10^{-4} are; 0.09290341 square meter; 929.0341 square centimeters.

Square Foot ($ft.^2$ or sq. ft.) (British).—0.09290289 square meter.

Square Hectometer (hm^2).—2.471044 acres (U. S.); 2.471058 acres (British); 1×10^4 square meters.

Square Inch ($in.^2$ or sq. in.) (U. S.).—1.59423×10^{-6} square chain; 1/144 or 0.0069444 square foot; 1/1296 or 0.000771605 square yard; 0.0159423 square link; 1×10^6 square mils; 1.27324×10^6 circular mils; 6.4516258×10^{-4} square meter; 6.4516258 square centimeters; 645.16258 square millimeters.

Square Inch ($in.^2$ or sq. in.) (British). 6.4515898 square centimeters.

Square Kilometer (km^2).—0.3861006 square mile (U. S.); 247.1044 acres (U. S.); 247.1058 acres (British); 1.1960×10^6 square yards; 1.0764×10^7 square feet; 1×10^6 square meters.

Square Link ($li.^2$ or sq. li.) (Gunter's).—1×10^{-5} acre; 1×10^{-4} square chain; 0.0016 square rod; 0.0484 square yard; 0.4356 square foot; 62.7264 square inches; 0.040469 square meter; 404.69 square centimeters.

Square Meter (m^2).—3.8610×10^{-7} square mile; 2.471044×10^{-4} acre (U. S.); 2.471058×10^{-4} acre (British); 0.00247104 square chain (Gunter's); 0.039537 square rod; 1.195985 square yards (U. S.); 1.195992 square yards (British); 10.76387 square feet (U. S.); 10.76390 square feet (British); 24.7104 square links (Gunter's); 1550.0 square inches; 1×10^{-6} square kilometer; 1×10^{-4} hectare or square hectometer; 0.01 are; 1 centare 1×10^4 square centimeters; 1×10^6 square millimeters.

Square Mil.—1×10^{-6} square inch; 1.2732 circular mils; 6.4516×10^{-6} square centimeter; 6.4516×10^{-4} square millimeter.

Square Mile ($mi.^2$ or sq. mi.).—640 acres; 6400 square chains; 1.02400×10^5 square rods; 3.0976×10^6 square yards; 2.78784×10^7 square feet; 2.589998 square kilometers; 258.9998 hectares; 2.589998×10^6 square meters.

Square Millimeter (mm^2).—0.0015500 square inch; 1550.0 square mils; 1973.5 circular mils; 1×10^{-6} square meter; 0.01 square centimeter; 1.2732 circular millimeters.

Square Perch (British & U. S.).—1/160 or 0.00625 acre; 30.25 square yards; 25.293 square meters.

Square Pole (British).—30.25 square yards.

Square Rod (rd. ^{2} or sq. rd.).—9.765625×10^{-6} mile; 0.00625 acre; 0.0625 square chain (Gunter's); 30.25 square yards; 272.25 square feet; 625 square links (Gunter's); 3.9204×10^4 square inches; 0.0025293 hectare or square hectometer; 25.293 square meters or centares.

Square Yard (yd. ^{2} or sq. yd.) (U. S.).—3.22831×10^{-7} square mile; 2.06612×10^{-4} acre; 0.00206612 square chain; 0.0330579 square rod or square perch; 9 square feet; 20.6612 square link 1296 square inches; 8.36131×10^{-5} hectare; 0.0083613 square dekameter or are; 0.83613 square meter or centare; 8361.31 square centimeters.

Square Yard (yd. ^{2} or sq. yd.) (British).—2.0661×10^{-4} acre (British); 8.2645×10^{-4} rood (British); 0.836126 square meter.

Steradian.—$1/4\pi$ of the solid angle around a point; 0.07958 sphere; 0.15916 hemisphere; 0.6366 spherical right angle; 3282.8 square degrees.

Stere (s).—0.1 dekastere; 1 cubic meter; 10 decisteres; 999.973 liters.

Stone (British).—14 pounds (avoirdupois); 6.350 kilograms.

Strike (British).—2 bushels (dry); 0.072738 cubic meter.

Toise (French).—6 Paris feet; 1.9490365 meters (legal, 1799); 1.949090 meters (measured, 1887).

Ton (long) (tn. l.) (U. S. or British).—1.12000 tons (short); 22.400 hundredweights (short); 2240 pounds (avoirdupois); 2722.22 pounds (apothecary or troy); 3.5840×10^4 ounces (avoirdupois); 1.0160470 metric tons; 1016.0470 kilograms.

Ton (short) (tn. sh.) (U. S.).—0.89286 ton (long); 20 hundredweights (short); 2000 pounds (avoirdupois); 2430.56 pounds (apothecary or troy); 2.916666×10^4 ounces (apothecary or troy); 3.2000×10^4 ounces (avoirdupois); 0.907185 ton (metric); 907.185 kilograms.

Tonne (t) (metric ton, millier).—0.984206 ton (long); 1.10231 tons (short); 22.046223 hundredweights (short); 2204.62 pounds (avoirdupois); 2679.23 pounds (apothecary or troy); 3.527396×10^4 ounces (avoirdupois); 1000 kilograms; 1×10^6 grams.

Township (U. S.).—36 square miles; 2.3040×10^4 square yards; 93.240 square kilometers.

Tun.—252 gallons.

Week (wk.).—168 hours; 1.0080×10^4 minutes; 6.04800×10^5 seconds.

Wey (British, capacity).—*40 bushels.

Wey (British, mass).—*252 pounds.

Yard (yd.) (U. S.).—5.68182 × 10^{-4} mile; 0.00454545 furlong; 0.0454545 chain (Gunter's); 0.181818 rod; 3 feet; 4.54545 links (Gunter's); 36 inches; 3600/3937 or 0.91440183 meter; 91.440183 centimeters.

Yard (yd.) (British).—0.18182 pole (British); 4 quarters (British, linear); 0.9143992 meter (present legal equivalent of Imperial yard); 91.43992 centimeters; 1.420212 × 10^6 wave lengths of red line of cadmium.

Year (yr.) (leap).—366 days; 8784 hours.

Year (yr.) (tropical, mean solar).—365.2422 day (mean solar); 8765.8128 hours (mean solar); 3.15569 × 10^7 seconds (mean solar).

Year (yr.) (sidereal).—365.256 days (mean solar); 8766.144 hours (mean solar).

---

*Variable.

Reciprocal Units

x per **Ångström** = 1 × 10^8 x per centimeter.

x per **circular mil** = 1.9735 × 10^5 x per square centimeter.

x per **circular millimeter** = 127.324 x per square centimeter.

x per **circumference** = 0.159155 x per radian.

x per **cubic foot** = 3.5314 × 10^{-5} x per cubic centimeter.

x per **cubic inch** = 0.061023 x per cubic centimeter.

x per **cubic yard** = 1.3079 x per cubic meter.

x per **day (mean solar)** = 1.15741 × 10^{-5} x per second (mean solar).

x per **degree** = 57.29578 x per radian.

x per **entire space** = 0.079577 x per steradian.

x per **foot** = 0.032808 x per centimeter.

x per **gallon (British)** = 2.1997 × 10^{-4} x per cubic centimeter.

x per **gallon (U. S.)** = 2.6417 × 10^{-4} x per cubic centimeter.

x per **grain** = 0.01543236 x per milligram.

x per **hemisphere** = 0.15916 x per steradian.

x per **hour (mean solar)** = 2.77778 × 10^{-4} x per second (mean solar).

x per **inch** = 0.39370 x per centimeter.

x per **liter** = 9.9997×10^{-4} x per cubic centimeter.

x per **micron** = 1.0000×10^{4} x per centimeter.

x per **mil** = 393.70 x per centimeter.

x per **mile** = 0.62137 x per kilometer.

x per **minute** = 3437.75 x per radian.

x per **minute (mean solar)** = 0.0166667 x per second (mean solar).

x per **ounce (avoirdupois)** = 0.035274 x per gram.

x per **ounce (apothecary or troy)** = 0.032151 x per gram.

x per **ounce (fluid, British)** = 0.035195 x per cubic centimeter.

x per **ounce (fluid, U. S.)** = 0.033814 x per cubic centimeter.

x per **pound (avoirdupois)** = 0.00220462 x per gram.

x per **quart (dry, U. S.)** = 9.0808×10^{-4} x per cubic centimeter.

x per **quart (liquid, U. S.)** = 0.0010567 x per cubic centimeter.

x per **quart (British)** = 8.7988×10^{-4} per cubic centimeter.

x per **second** = 2.06265×10^{5} x per radian.

x per **second (sidereal)** = 1.002738 x per second (mean solar).

x per **square degree** = 3282.8 x per steradian.

x per **square foot** = 0.0010764 x per square centimeter.

x per **square inch** = 0.15500 x per square centimeter.

x per **square meter** = 1×10^{-4} x per square centimeter.

x per **square mile** = 0.38610 x per square kilometer.

x per **square millimeter** = 100.0000 x per square centimeter.

x per **square yard** = 1.19599×10^{-4} x per square centimeter.

x per **ton (2000 pounds)** = 0.00110231 x per kilogram.

x per **ton (2240 pounds)** = 9.8421×10^{-4} x per kilogram.

x per **year (mean solar)** = 0.00273781 x per day (mean solar) = 3.16888×10^{-8} x per second (mean solar).

Velocity [lt^{-1}]

Centimeter per second.—3.728×10^{-4} mile per minute; 0.02237 mile per hour; 0.032808 foot per second; 0.03600 kilometer per hour; 0.6000 meter per minute; 1.9685 feet per minute.

Degree per second.—0.002778 revolution per second; 0.017453 radian per second; 0.1667 revolution per minute.

Foot per minute.—0.005080 meter per second; 0.011364 mile per hour; 0.016667 foot per second; 0.01829 kilometer per hour; 0.3048 meter per minute; 0.5080 centimeter per second.

Foot per second.—0.011364 mile per minute; 0.5921 knot; 0.6818 mile per hour; 1.0973 kilometers per hour; 18.29 meters per minute; 30.4801 centimeters per second.

Kilometer per hour.—0.016667 kilometer per minute; 0.27778 meter per second; 0.5396 knot; 0.6214 mile per hour; 0.9113 foot per second; 16.67 meters per minute; 27.7778 centimeters per second; 54.68 feet per minute.

Kilometer per minute.—0.6215 mile per minute; 37.284 miles per hour; 60 kilometers per hour; 1666.7 centimeters per second; 3280.8 feet per minute.

Knot.—1 nautical mile per hour; 1.1516 miles per hour; 1.689 feet per second; 1.853 kilometers per hour; 51.48 centimeters per second; 6080.20 feet per hour.

Meter per minute.—0.03728 mile per hour; 0.05468 foot per second; 0.06 kilometer per hour; 1.6667 centimeters per second; 3.281 feet per minute.

Meter per second.—0.03728 mile per minute; 0.06000 kilometer per minute; 2.2369 miles per hour; 3.281 feet per second; 3.600 kilometers per hour; 196.8 feet per minute.

Mile per hour.—0.016667 mile per minute; 0.8684 knot; 1.4667 feet per second; 1.6093 kilometers per hour; 26.82 meters per minute; 44.7041 centimeters per second; 88 feet per minute.

Mile per minute.—52.104 knot; 1.609 kilometers per minute; 60 miles per hour; 88 feet per second; 2682.2 centimeters per second.

Radian per second.—0.1592 revolution per second; 9.549 revolutions per minute; 57.296 degrees per second.

Revolution per day.—7.2722×10^{-5} radian per second.

Revolution per minute (R.P.M.).—0.01667 revolution per second; 0.10472 radian per second; 6 degrees per second.

Revolution per second.—6.2832 radians per second; 60 revolutions per minute; 360 degrees per second.

Velocity of light.—2.9986×10^{10} centimeters per second.

Acceleration [$l\ t^{-2}$]

Centimeter per second per second.—0.02237 mile per hour per second; 0.03281 foot per second per second; 0.03600 kilometer per hour per second.

Foot per second per second.—0.304801 meter per second per second; 0.6818 mile per hour per second; 1.097 kilometer per hour per second; 30.4801 centimeter per second per second.

Gravity, standard.—32.174 feet per second per second; 980.665 centimeters per second per second.

Kilometer per hour per second.—0.27778 meter per second per second; 0.6214 mile per hour per second; 0.9133 foot per second per second; 27.778 centimeters per second per second.

Meter per second per second.—2.237 miles per hour per second; 3.2808 feet per second per second; 3.600 kilometers per hour per second; 100.00 centimeters per second per second.

Mile per hour per minute.—0.74507 centimeter per second per second.

Mile per hour per second.—0.44704 meter per second per second; 1.467 feet per second per second; 1.609 kilometers per hour per second; 44.704 centimeters per second per second.

Radians per second per second.—0.1592 revolution per second per second; 9.549 revolutions per minute per second; 572.96 revolutions per minute per minute.

Revolution per minute per second.—0.10420 radian per second per second.

Revolution per minute per minute.—2.778×10^{-4} revolution per second per second; 0.0017453 radian per second per second; 0.01667 revolution per minute per second.

Revolution per second per second.—6.2832 radians per second per second; 60 revolutions per minute per second; 3600 revolutions per minute per minute.

Density [$m\ l^{-3}$]

Demal.—1 gram equivalent per cubic decimeter.

Grain per cubic foot.—2.288 grams per cubic meter.

Gram per cubic centimeter.—3.405×10^{-7} pound per mil-foot; 0.03613 pound per cubic inch; 8.3452 pounds per gallon

(U. S.); 10.022 pounds per gallon (British); 62.43 pounds per cubic foot.

Gram per cubic meter.—0.437 grains per cubic foot.

Gram per milliliter.—(Numerically equal to specific gravity t°/4°); 0.999973 gram per cubic centimeter.

Kilogram per cubic meter.—3.613 × 10^{-5} pound per cubic inch; 0.001 gram per cubic centimeter; 0.06243 pound per cubic foot.

Mercury at 0°C.—13.5951 grams per cubic centimeter (Internationally accepted conventional value to be used in expressing pressures in terms of columns of mercury.)

Pound per cubic foot.—5.787 × 10^{-4} pound per cubic inch; 0.016018 gram per cubic centimeter; 16.018 kilograms per cubic meter.

Pound per cubic inch.—27.680 grams per cubic centimeter; 2.768 × 10^4 kilograms per cubic meter.

Pound per mil foot.—2.9369 × 10^6 grams per cubic centimeter.

Pound per gallon (U. S.).—0.119826 gram per cubic centimeter.

Pound per gallon (British).—0.099776 gram per cubic centimeter.

Slug per cubic foot.—0.5154 gram per cubic centimeter.

Mass Concentration

Gram per metric ton.—1.0000 milligram per kilogram.

Gram per ton (2000 pound).—1.1023 milligrams per kilogram.

Gram per ton (2240 pound).—0.9842 milligram per kilogram.

Karat (1 of gold to 24 of mixture).—41.667 milligrams per gram.

Milligram per assay ton (Equals one troy ounce per 2000 pound (avoirdupois).)—34.276 milligrams per kilogram.

Milligram per kilogram.—0.002 pound (avoirdupois) per ton (2000 pound); 0.029175 milligram per assay ton; 0.032000 ounce (avoirdupois) per ton (2000 pound); 1 gram per metric ton.

Ounce (avoirdupois) per ton (2000 pound.).—31.2500 milligrams per kilogram.

Ounce (avoirdupois) per ton (2240 pound).—27.9018 milligrams per kilogram.

Pound (avoirdupois) per ton (2000 pound).—500.000 milligrams per kilogram.

Pound (avoirdupois) per ton (2240 pound).—446.429 milligrams per kilogram.

Flow $[l^3t^{-1}]$

Cubic centimeter per second.—0.0021186 cubic foot per minute.

Cubic foot per minute.—0.1247 gallon per second; 0.4720 liter per second; 62.4 pounds of water per minute; 472.0 cubic centimeters per second.

Cubic foot per second.—2.2222 cubic yards per minute; 448.83 gallons per minute; 1699.3 liters per minute.

Cubic yard per minute.—0.45 cubic foot per second; 3.367 gallons per second; 12.74 liters per second.

Gallon per second.—0.297 cubic yard per minute; 8.0192 cubic feet per minute.

Gallon per minute.—0.002228 cubic foot per second; 0.06308 liter per second.

Liter per minute.—5.885×10^{-4} cubic foot per second; 0.004403 gallon per second.

Liter per second.—0.078493 cubic yard per minute; 2.12 cubic feet per minute; 15.85 gallons per minute (U. S.).

Miner's Inch.—1.2 cubic feet per minute.

Pounds of water per minute.—0.01603 cubic foot per minute.

Force $[mlt^{-2}]$

Conversion factors between the absolute and gravitational units of force, torque, energy and power are dependent on the value of g, the acceleration due to gravity. The standard value of g adopted by the International Committee on Weights and Measures is 980.665 cm / sec². This value or its equivalent, 32.174 ft. / sec², is used except where otherwise noted.

Dyne.—2.2481×10^{-6} pound weight; 7.2330×10^{-5} poundal; 0.0010197 gram weight; 0.015737 grain weight.

Grain weight.—63.546 dynes.

Gram weight—0.070932 poundal; 980.665 dynes.

Kilogram weight.—70.932 poundals; 9.80665×10^5 dynes.

Newton.—1×10^5 dynes.

Poundal.—0.031081 pound weight; 14.098 grams weight; 1.3825×10^4 dynes.

Pound weight.—32.174 poundals; 453.59 grams weight; 4.4482×10^5 dynes.

Ton weight (2000 pound).—8.8964×10^8 dynes.

Ton weight (2240 pound).—9.9640×10^8 dynes.

RECIPROCAL FORCE $[m^{-1}\, l^{-1}\, t^2]$

x per **gram weight**$=0.0010197\ x$ per dyne.

x per **poundal**$=7.2330 \times 10^{-5}\ x$ per dyne.

x per **pound weight**$=2.2481 \times 10^{-6}\ x$ per dyne.

Pressure $[m\, l^{-1}\, t^{-2}]$

Atmosphere (normal).—Pressure exerted by 76 cm of Hg, density 13.5951 g / cm^3, $g=980.665$ cm / sec^2; 0.0073480 ton (2000 pound) per square inch; 1.0133 bars; 1.0581 tons (2000 pound) per square foot; 14.696 pounds per square inch; 29.921 inches of mercury at 32° F; 33.899 feet of water at 39.1° F; 760 millimeters of mercury at 0° C; 1033.2 grams per square centimeter; 2116.2 pounds per square foot; 1.0332×10^4 kilograms per square meter; 1.01325×10^6 dynes per square centimeter.

Bar.—0.98692 atmosphere; 14.504 pounds per square inch, 1.01971×10^4 kilograms per square meter; 1.000×10^6 dynes per square centimeter. (This value accords with the only internationally accepted use of this term; but "bar" has also been used to denote a pressure of one dyne per square centimeter).

Barye.—1.0000 dyne per square centimeter.

Centimeter of mercury at 0 °C.—0.013158 atmosphere; 0.19337 pound per square inch; 0.44604 foot of water; 27.845 pounds per square foot; 135.95 kilograms per square meter; 1.33322×10^4 dynes per square centimeter.

Centimeter of water at 4 °C.—980.638 dynes per square centimeter.

Dyne per square centimeter.—9.8692×10^{-7} atmosphere; 1×10^{-6} bar; 1.4504×10^{-5} pound per square inch; 2.9530×10^{-5} inch of mercury at 32 °F; 4.0148×10^{-4} inch of water at 4 °C; 7.5006×10^{-4} millimeter of mercury; 0.00101971 gram per square centimeter; 0.00101974 centimeter of water at 4 °C; 0.0020886 pound per square foot; 0.0101971 kilogram per square meter.

Foot of water at 4 °C or 39.1 °F.—0.029499 atmosphere; 0.43352 pound per square inch; 0.88265 inch of mercury at

32°F; 62.426 pounds per square foot; 304.79 kilograms per square meter.

Gram (weight) per square centimeter.—9.6784×10^{-4} atmosphere; 0.014223 pound per square inch; 0.73556 millimeter of mercury at 0°C; 2.0482 pound per square foot; 10 kilograms per square meter; 980.665 dynes per square centimeter.

Inch of mercury at 32°F.—0.033421 atmosphere; 0.49116 pound per square inch; 1.13299 feet of water at 39.1°F; 13.595 inches of water at 4°C; 70.727 pounds per square foot; 345.31 kilograms per square meter; 3.38639×10^{4} dynes per square centimeter.

Inch of water at 4°C.—0.0024583 atmosphere; 0.036127 pound per square inch; 0.073554 inch of mercury; 0.57818 ounce per square inch; 5.2022 pounds per square foot; 25.399 kilograms per square meter; 2490.82 dynes per square centimeter.

Kilogram (weight) per square centimeter.—14.223 pounds per square inch; 73.556 centimeters of mercury at 0°C; 980,665 dynes per square centimeter.

Kilogram (weight) per square meter.—9.6784×10^{-5} atmosphere; 0.0014223 pound per square inch; 0.0028959 inch of mercury; 0.0032809 foot of water; 0.073556 millimeter of mercury; 0.1 gram per square centimeter; 0.20482 pound per square foot; 98.0665 dyne per square centimeter.

Kilogram (weight) per square millimeter.—0.71114 ton (2000 pounds) per square inch; 1×10^{6} kilograms per square meter; 9.80665×10^{7} dynes per square centimeter.

Millimeter of mercury at 0°C.—0.0013158 atmosphere; 0.019337 pound per square inch; 1.3595 grams per square centimeter; 2.7845 pounds per square foot; 13.595 kilograms per square meter; 1333.22 dynes per square centimeter.

Ounce (weight) per square inch.—0.0625 pound per square inch; 4309.2 dynes per square centimeter.

Pound (weight) per square foot.—4.7254×10^{-4} atmosphere; 4.7880×10^{-4} bar; 0.0069445 pound per square inch; 0.016018 foot of water at 39.1°F; 0.35913 millimeter of mercury at 0°C; 0.48824 gram per square centimeter; 4.8824 kilograms per square meter; 478.80 dynes per square centimeter.

Pound (weight) per square inch.—5×10^{-4} ton (2000 pound) per square inch; 0.068046 atmosphere; 0.068947 bar; 0.070307 kilogram per square centimeter; 2.0360 inches of mercury at 32°F; 2.3066 feet of water at 39.1°F; 5.1715 centimeters of mercury at 0°C; 27.673 inches of water at 4°C; 51.715 millimeters of mercury; 70.307 grams per square centimeter; 703.07 kilograms per square meter; 6.8947×10^{4} dynes per square centimeter.

Ton (2000 pound) (weight) per square foot.—0.94509 atmosphere; 13.889 pounds per square inch; 9764.8 kilograms per square meter; 9.5760×10^5 dynes per square centimeter.

Ton (2240 pound) (weight) per square foot.—10.7251×10^5 dynes per square centimeter.

Ton (2000 pound) (weight) per square inch.—1.4062 kilograms per square millimeter; 2000 pounds per square inch; 1.4062×10^6 kilograms per square meter; 1.3789×10^8 dynes per square centimeter.

Ton (2240 pound) (weight) per square inch.—1.5749 kilograms per square millimeter; 152.42 atmospheres; 1.5444×10^8 dynes per square centimeter.

Work and Energy $[m\, l^2\, t^{-2}]$

British thermal unit (mean) (BTU).—2.930×10^{-4} kilowatt-hour; 3.9292×10^{-4} horse power-hour; 0.25198 kilogram-calorie or large calorie (mean); 0.2930 watt-hour; 10.409 liter-atmospheres; 107.56 kilogram-meters; 251.98 gram-calories (mean); 777.97 foot-pounds; 1054.8 joules (absolute); 0.3676 cubic foot-atmospheres; 2.5030×10^4 foot-poundals; 1.0548×10^{10} ergs.

British thermal unit (39 °F) (BTU).—1060.4 joules (absolute).

British thermal unit (60 °F) (BTU).—1054.6 joules (absolute).

Calorie.—*See* gram-calorie or kilogram-calorie.

Centigrade thermal unit (15 °C) (CTU).—1898.3 joules (absolute).

Centimeter-dyne.—*See* erg.

Centimeter-gram force.—*See* gram-centimeter.

Cheval-vapeur heure.—2.6478×10^6 joules (absolute).

Cubic centimeter-atmosphere (normal).—0.101325 joule (absolute).

Cubic foot atmosphere.—2.7203 British thermal unit (mean); 28.313 liter-atmospheres; 292.59 kilogram-meters; 680.74 gram-calories (mean); 2116.3 foot-pounds; 2869.4 joules (absolute).

Erg.—2.3889×10^{-11} kilogram-calorie (mean); 9.4805×10^{-11} British thermal unit (mean); 1.0197×10^{-8} kilogram-meter; 2.3889×10^{-8} gram-calorie (mean); 7.3756×10^{-8} foot-pound; 1×10^{-7} joule; 2.3730×10^{-6} foot-poundal; 0.0010197 gram-centimeter; 1 dyne-centimeter.

Foot-Pound.—3.7662×10^{-7} kilowatt-hour; 5.0505×10^{-7} horse power-hour; 3.2389×10^{-4} kilogram-calorie (mean); 3.7662×10^{-4} watt-hour; 4.7253×10^{-4} cubic foot-atmosphere; 0.0012854 British thermal unit (mean); 0.013381 liter-atmosphere; 0.138255 kilogram-meter; 0.32389 gram-calorie (mean); 1.35582 joule (absolute); 32.174 foot-poundals; 1.3825×10^{4} gram-centimeters; 1.35582×10^{7} ergs or centimeter-dynes.

Foot-poundal.—3.9952×10^{-5} British thermal unit (mean); 4.1589×10^{-4} liter-atmosphere (normal); 0.0042972 kilogram-meter; 0.010067 gram-calorie; 0.031081 foot-pound; 0.042140 joule; 4.21402×10^{5} ergs.

Gram-calorie (mean).—1.5593×10^{-6} horse power hours; 0.001 kilogram-calorie; 0.0011628 watt-hour; 0.001459 cubic foot-atmosphere; 0.0039685 British thermal unit (mean); 0.041311 liter-atmosphere; 0.42685 kilogram-meter; 3.0874 foot-pounds; 4.186 joules (absolute); 99.334 foot-poundals.

Gram-calorie (15 °C).—4.185 joules (absolute).

Gram-calorie (20 °C).—4.181 joules (absolute).

Gram-centimeter.—2.3427×10^{-8} kilogram-calorie (mean); 9.2972×10^{-8} British thermal unit (mean); 1×10^{-5} kilogram-meter; 2.3427×10^{-5} gram-calorie (mean); 7.233×10^{-5} foot-pound; 9.80665×10^{-5} joule (absolute); 980.7 ergs.

Horse power hour. (**HP hr. or h. p. hr.**).—0.7457 kilowatt-hour; 641.30 kilogram-calories (mean); 745.7 watt-hours; 2545.0 British thermal units (mean); 2.7374×10^{5} kilogram-meters; 1.9800×10^{6} foot-pounds; 2.6845×10^{6} joules (absolute).

Horse power hour (**electrical, U. S. & British**).—2.6856×10^{6} joules (absolute).

International volt (v) **electronic charge**).—1.5927×10^{-19} joule (absolute).

International volt (v) **Faraday.**—9.6541×10^{4} joules (absolute).

Joule (absolute).—2.778×10^{-7} kilowatt-hour; 3.725×10^{-7} horse power-hour; 2.3889×10^{-4} kilogram-calorie (mean); 2.778×10^{-4} watt-hour; 3.485×10^{-4} cubic foot-atmosphere; 9.480×10^{-4} British thermal unit (mean); 0.009869 liter-atmosphere; 0.10197 kilogram-meter; 0.23889 gram-calorie (mean); 0.23895 gram-calorie at 15 °C; 0.23918 gram-calorie at 20 °C; 0.73756 foot-pound; 0.999835 joule (International); 1 watt-second; 23.730 foot-poundals; 1.0197×10^{4} gram-centimeters; 1×10^{7} ergs.

Joule (**International**).—1.000165 joule (absolute).

Kilogram-calorie or large calorie (mean).—0.0011628 kilowatt-hour; 0.0015593 horse power-hour; 1.1628 watt-hour; 3.9685 British thermal units (mean); 426.85 kilogram-meters; 1000 small or gram-calories; 3087.4 foot-pounds; 4186 joules; 4.2686×10^{7} gram-centimeters; 4.186×10^{10} ergs.

Kilogram-meter.—2.7235×10^{-6} kilowatt hour; 3.6530×10^{-6}

horse power-hour; 0.0027235 watt-hour; 0.0034177 cubic foot-atmosphere; 0.0092972 British thermal unit (mean); 0.096782 liter-atmosphere; 2.3427 gram-calories (mean); 7.2330 foot-pounds; 9.80665 joules (absolute); 232.71 foot-poundals; 1×10^5 gram-centimeters; 9.80665×10^7 ergs.

Kilowatt-hour.—1.3410 horse power-hours; 1000 watt-hours; 3413.0 British thermal units (mean); 3.6710×10^5 kilogram-meters; 8.6001×10^5 gram-calories (mean); 2.6552×10^6 foot-pounds; 3.6000×10^6 joules (absolute).

Large Calorie.—*See* kilogram-calorie.

Liter-atmosphere (normal).—3.7745×10^{-5} horse power-hour; 0.035319 cubic foot-atmosphere; 0.09607 British thermal unit (mean); 10.333 kilogram-meters; 24.206 gram-calories (mean); 74.735 foot-pounds; 101.328 joules (absolute); 2404.5 foot-poundals.

Liter-atmosphere (lat. 45°, g=980.616).—101.323 joules (absolute).

Megalerg.—1×10^6 ergs.

Meter-kilogram.—*See* kilogram-meter.

Watt-hour.—0.001 kilowatt-hour; 0.0013410 horse power-hour; 0.86001 kilogram-calorie (mean); 3.4130 British thermal units (mean); 367.10 kilogram-meters; 860.01 gram-calories (mean); 2655.3 foot-pounds; 3600 joules.

Power $[m\, l^2\, t^{-3}]$

British thermal unit (BTU) (mean) per minute.—0.023575 horse power; 17.580 watts (absolute).

British thermal unit (BTU) (mean) per second.—1.4145 horse power; 1054.8 watts (absolute).

British thermal unit (BTU) (39°F) per second.—1060.4 watts (absolute).

British thermal unit (BTU) (60°F) per second.—1054.6 watts (absolute).

Cheval-vapeur.—For electrical purposes usually used as 736 watts. *See* Force de cheval.

Erg per second.—1×10^{-10} kilowatt; 1.3412×10^{-10} horse power; 1.4333×10^{-9} kilogram-calorie (mean) per minute; 5.688×10^{-9} British thermal unit (mean) per minute; 7.3756×10^{-8} foot-pound per second; 1×10^{-7} watt; 4.4254×10^{-6} foot-pound per minute; 1 dyne-centimeter per second.

Foot-pound per minute.—2.2597×10^{-5} kilowatt; 3.0303×10^{-5} horse power; 3.072×10^{-5} horse power (metric); 3.2389×10^{-4}

kilogram-calorie (mean) per minute; 0.0012854 British thermal unit (mean) per minute; 0.016667 foot-pound per second; 0.022597 watt.

Foot-pound per second.—0.0013558 kilowatt; 0.0018182 horse power; 0.019433 kilogram-calorie (mean) per minute 0.077124 British thermal unit (mean) per minute; 1.35582 watt (absolute).

Force de cheval (cheval-vapeur).—*See* horse power (metric).

Gram-centimeter per second.—9.80665×10^{-5} watt (absolute).

Hectowatt.—100 watts.

Horse power (h. p. or HP).—0.70696 British thermal unit (mean) per second; 0.7452 kilowatt ($g=980$); 0.74570 ($g=980.665$) kilowatt; 1.0139 horse power (metric) or cheval-vapeur; 10.688 kilogram-calories (mean) per minute; 42.418 British thermal units (mean) per minute; 550 foot-pounds per second; 745.2 watts ($g=980$); 745.70 watts ($g=980.665$); 3.3000×10^4 foot-pounds per minute.

Horse power, electrical (U. S. & British).—746.00 watt (absolute) (Commonly used in rating electrical machinery).

Horse power, metric (cheval vapeur).—0.98632 horse power (U. S.); 75 kilogram-meters per second; 735.499 watts; 3.2549×10^4 foot-pounds per minute.

Kilogram-calorie (mean) per minute.—0.093557 horse power; 51.457 foot-pounds per second; 69.767 watts.

Kilogram calorie (mean) per second.—4.186 kilowatts.

Kilogram-meter per second.—9.80665 watts (absolute).

Kilowatt.—0.23889 kilogram-calorie (mean) per second; 0.94827 British thermal unit (mean) per second; 1.3410 horse power; 1.3597 horse power (metric); 14.333 kilogram-calories (mean) per minute; 56.896 British thermal units (mean) per minute; 737.56 foot-pounds per second; 1000 watts; 4.4254×10^4 foot-pounds per minute; 2.6552×10^6 foot-pounds per hour.

Lumen.—0.001496 watt.

Metric horse power.—*See* horse power, metric.

Watt (absolute).—0.001 kilowatt; 0.0013410 horse power; 0.0013596 force de cheval or horse power (metric); 0.01433 kilogram-calorie (mean) per minute; 0.056896 British thermal unit (mean) per minute; 0.73756 foot-pound per second; 1 joule per second; 44.254 foot-pounds per minute; 1×10^7 ergs per second.

Watt (International).—1.000165 watt (absolute).

Watt of maximum visibility radiation.—668 lumens.

Action $[m\, l^2\, t^{-1}]$

Calorie (15°C) second.—6.3854×10^{33} quanta.

Calorie (15°C) second / N_o*—1.0535×10^{10} quanta.

Joule second.—1.5258×10^{33} quanta.

Joule second / N_o*.—2.5173×10^{9} quanta.

Planck's quantum.—6.624×10^{-27} erg second.

Volt electronic-charge second.—2.4292×10^{14} quanta.

Volt faraday second.—1.4724×10^{38} quanta.

---

*N_o denotes Avogadro's number, the number of molecules per gram mole.

Torque or Moment of Force $[m\, l^2\, t^{-2}]$

Dyne-centimeter.—1.0197×10^{-8} kilogram-meter; 7.3757×10^{-8} pound-foot; 8.8511×10^{-7} pound-inch; 2.3731×10^{-6} poundal-foot.

Kilogram-meter.—9.8066×10^{7} dyne-centimeters.

Pound-foot.—1.3558×10^{7} dyne-centimeters.

Poundal-foot.—4.2140×10^{5} dyne-centimeters.

Pound-inch.—1.1298×10^{6} dyne-centimeters.

Moment of Area $[l^4]$

Square centimeter-centimeter squared.—0.02402 square inch-inch squared.

Square foot-foot squared.—2.074×10^{4} square inch-inch squared.

Square inch-inch squared.—4.823×10^{-5} square foot-foot squared; 41.62 square centimeter-centimeter squared.

Moment of Inertia $[m\, l^2]$

Gram-centimeter squared (g cm^2).—2.3730×10^{-6} pound-foot squared; 3.4172×10^{-4} pound-inch squared.

Kilogram-centimeter squared.—0.0023730 pound-foot squared; 0.3417 pound-inch squared.

Pound-foot squared.—144 pound-inches squared; 421.40 kilogram-centimeters squared; 4.2140×10^{5} gram-centimeters squared.

Pound-inch squared.—0.006945 pound-foot squared; 2.9264 kilogram-centimeters squared; 2926.4 gram-centimeters squared.

Thermal Units

TEMPERATURE

Degree Centigrade (°C).—0.8 or 4 / 5 degree Réaumur; 1.00 degree absolute, Kelvin; 1.8 or 9 /5 degrees Fahrenheit.

Degree Fahrenheit (°F).—0.44444 or 4 /9 degree Réaumur; 0.55556 or 5 /9 degree Centigrade.

Degree Réaumur (°R).—1.25 or 5 /4 degrees Centigrade; 2.25 or 9 /4 degrees Fahrenheit.

Temperature, absolute Centigrade or Kelvin (K) scale.—$x°\,K = T\,°C + 273.18$.

Temperature, degrees Centigrade (°C).—$x\,°C = 5/9\,(T\,°F - 32)$; $x\,°C = 5/4\,T\,°R$.

Temperature, degrees Fahrenheit (°F).—$x\,°F = 9/5\,T\,°C + 32$; $x\,°F = 9/4\,T\,°R + 32$.

Temperature, degrees Réaumur (°R).—$x\,°R = 4/9\,(T\,°F - 32)$; $x°R = 4/5\,T°C$.; Rankine = °F + 459.60.

THERMAL CAPACITY OF A SUBSTANCE

British thermal unit (mean) per pound per °F.—1 gram-calorie per gram per °C; 4.186 joules per gram per °C.

Gram-calorie (mean) per gram per °C.—1 British thermal unit (60 °F) per pound per °F; 4.186 joules per gram per °C.

Joule per gram per °C.—0.2389 gram-calorie (mean) per gram per °C; 0.2389 British thermal unit (mean) per pound per °F.

THERMAL CAPACITY OF A BODY. WATER EQUIVALENT

British thermal unit (60 °F) per °F.—453.59 gram-calories per °C; 1898.3 joules per °C.

Gram-calorie (15°) per °C.—0.0022046 British thermal unit (60 °F) per °F; 4.185 joules per °C.

Joule per °C.—5.268×10^{-4} British thermal unit (60 °F) per °F; 0.2389 gram-calorie per °C.

HEAT EQUIVALENT. LATENT HEAT

British thermal unit (mean) per pound.—0.5556 gram-calorie (mean) per gram; 2.325 joules per gram.

Gram-calories (mean) per gram.—1.8 British thermal units (mean) per pound; 4.186 joules per gram.

Joule per gram.—0.2389 gram-calories (mean) per gram; 0.4301 British thermal unit per pound.

THERMAL CONDUCTIVITY

British thermal unit (mean) per square foot per second for a temperature gradient of 1 °F per inch=5.191 joules (absolute) per square centimeter per second for a temperature gradient of 1 °C per centimeter=1.2404 gram-calories (15 °C) per square centimeter per second for a temperature gradient of 1 °C per centimeter.

Gram-calorie (15 °C) per square centimeter per second for a temperature gradient of 1 °C per centimeter=4.185 joules (absolute) per square centimeter per second for a temperature gradient of 1 °C per centimeter=0.80620 British thermal units (mean) per square foot per second for a temperature gradient of 1 °F per inch.

Joule per square centimeter per second for a temperature gradient of 1 °C per centimeter=0.2389 gram-calorie (15 °C) per square centimeter per second for a temperature gradient of 1 °C per centimeter=0.1926 British thermal unit per square foot per second for a temperature gradient of 1 °F per inch.

Photometric Units

Bougie Decimale (intensity of source).—1.0 International candle (approximately).

Candle (International) (intensity of source).—0.104 Carcel unit (approximately); 1.0000 International lumen per steradian; 1 Pentane candle (approximately); 1 English sperm candle (approximately); 1.11 Hefner unit (approximately).

Candle per square centimeter (surface brightness).—3.1416 lamberts; 3141.6 millilamberts.

Candle per square inch (surface brightness).—0.48695 lambert; 486.95 millilamberts.

Carcel unit (intensity of source).—9.6 International candle (approximately).

English sperm candle (intensity of source).—1.0 International candle (approximately).

Foot-candle (illumination of a surface).—1 lumen incident per square foot; 1.0764 milliphots; 10.764 lumen per square meter; 10.764 lux.

Hefner unit (intensity of source).—0.90 International candle (approximately).

Lambert (surface brightness).—0.3183 candle per square centimeter; 2.054 candles per square inch; 1 lumen emitted per square centimeter of a perfectly diffusing surface.

Lumen (flux of luminous energy).—Is emitted by 0.07958 spherical candle power. A source of one spherical candle power emits 4π or 12.566 lumens.

Lumen per square centimeter per steradian (surface brightness).—3.1416 lambert.

Lumen per square foot (illumination of a surface).—1 foot-candle; 10.764 lumens per square meter.

Lumen per square foot per steradian (surface brightness).—3.3816 millilambert.

Lumen per square meter (surface illumination).—1×10^{-4} phot; 0.092902 foot candle or lumen per square foot.

Lux (illumination of a surface).—1×10^{-4} phot; 0.1 milliphot; 0.092902 foot-candle; 1.000 lumen per square meter.

Meter-candle (illumination of a surface).—1.000 lumen per square meter.

Millilambert (surface brightness).—0.929 lumen emitted per square foot (perfect diffusion).

Milliphot (illumination of a surface).—0.001 phot; 0.929 foot-candle.

Pentane candle (intensity of source).—1.0 International candle (approximately).

Phot (illumination of a surface).—1 lumen incident per square centimeter; 1000 milliphots; 1.000×10^4 lumens per square meter; 1×10^4 lux.

Stilb (surface brightness).—1 candle per square centimeter.

Viscosity

VISCOSITY $[ml^{-1}t^{-1}]$

Gram weight second per square centimeter.—980.665 poise.

Poise.—1.00 gram per centimeter per second.

Pound weight second per square foot.—478.8 poise.

Pound weight second per square inch.—6.895×10^4 poise.

KINEMATIC VISCOSITY $[l^2 t^{-1}]$

Inch squared per second.—6.451 centimeters squared per second.

Poise centimeter cubed per gram.—1.000 centimeter squared per second.

Poise foot cubed per pound.—62.43 centimeters squared per second.

Poise inch cubed per gram.—16.387 centimeters squared per second.

RECIPROCAL VISCOSITY (FLUIDITY) $[m^{-1} lt]$

Rhe.—1.000 per poise.

Diffusivity; Coefficient of Diffusion $[l^2 t^{-1}]$

Centimeter squared per day.—1.1574×10^{-5} centimeter squared per second.

Inch squared per second.—6.4516 centimeters squared per second.

Liter per centimeter per day.—0.011574 centimeter squared per second.

Surface Tension $[mt^{-2}]$

Dyne per centimeter.—0.01 erg per square millimeter; 0.10197 milligram weight per millimeter; 1 erg per square centimeter; 2.5901 milligram weight per inch.

Erg per square centimeter.—0.01000 erg per square millimeter; 1.0000 dyne per centimeter.

Erg per square millimeter.—100.00 dynes per centimeter; 100.00 ergs per square centimeter.

Milligram weight per inch.—0.38609 dyne per centimeter.

Milligram weight per millimeter.—9.80665 dynes per centimeter.

Rotatory Power $[l^{-1}]$

Degree per centimeter.—0.017453 radian per centimeter.

Degree per foot.—5.7261×10^{-4} radian per centimeter.

Degree per inch.—0.0068714 radian per centimeter.

Minute per centimeter.—2.9089×10^{-4} radian per centimeter.

Radian per centimeter.—57.296 degrees per centimeter; 145.50 degrees per inch; 1746.4 degrees per foot; 3437.7 minutes per centimeter.

ELECTRICAL UNITS

Electrical units are designated as "absolute" when based on the electromagnetic cgs system, "International" when based on legal definitions of the ohm, Weston cell or silver voltammeter

The basis of International units is indicated as follows: "(a)" based on a silver deposit of 1 11800 mg per International ampere second; "(v)" based on the International ohm and Weston cell,—1.018300 volts at 20°C.

New adjusted values of International units were adopted in the United States on January 1, 1948. Relations between absolute and International units given below are based on these values.

Quantity or Charge $[\epsilon^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{3}{2}}t^{-1}]$, $[\mu^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}]$

Abcoulomb.—*See* electromagnetic cgs unit electrical quantity.

Ampere-hour (absolute).—3600.0 coulomb (absolute)

Coulomb (absolute).—0.1000 electromagnetic cgs unit or abcoulomb; 1.000165 International coulombs; 2.99796×10^{9} electrostatic cgs units or statcoulombs; 6.281×10^{18} electronic charges.

Electromagnetic cgs unit or abcoulomb.—10.0000 coulombs (absolute); 2.99796×10^{10} electrostatic cgs units or statcoulombs

Electronic charge.—1.5921×10^{-20} electromagnetic cgs unit or abcoulomb; 1.5921×10^{-19} coulomb (absolute), 4.774×10^{-10} electrostatic cgs unit or statcoulomb

Electrostatic cgs unit or statcoulomb.—3.33560×10^{-11} electromagnetic cgs unit or abcoulomb, 3.33560×10^{-10} coulomb (absolute), 2.0947×10^{9} electronic charges

Electrostatic foot-pound second unit.—1.1952×10^{-6} coulomb (absolute); 117.58 electromagnetic cgs units or abcoulombs; 3583.9 electrostatic cgs units or statcoulombs

Faraday.—9.6500×10^{4} coulombs (absolute); 9.6517×10^{4} International coulombs; 2.89365×10^{14} electrostatic cgs units or statcoulombs

International coulomb.—0.999835 coulomb (absolute)

Statcoulomb.—*See* electrostatic cgs unit

RECIPROCAL QUANTITY $[\epsilon^{-\frac{1}{2}}m^{-\frac{1}{2}}l^{-\frac{3}{2}}t]$; $[\mu^{\frac{1}{2}}m^{-\frac{1}{2}}l^{-\frac{1}{2}}]$

x per **ampere-hour** $= 2.7778 \times 10^{-4}$ x per coulomb (absolute)

x per **coulomb (absolute)** $= 0.999835$ x per International coulomb *x* per electromagnetic cgs unit=0.1000 *x* per coulomb (absolute)

x per electronic charge=6 281$\times10^{18}$ *x* per coulomb (absolute)

x per electrostatic cgs unit=2 99796$\times10^{9}$ *x* per coulomb (absolute)

x per faraday=1 0363$\times10^{-5}$ *x* per coulomb (absolute)

Current $[\epsilon^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{3}{2}}t^{-2}]$; $[\mu^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$

Abampere.—*See* electromagnetic cgs unit.

Ampere (absolute).—1.0363$\times10^{-5}$ faraday per second; 0.1 electromagnetic cgs unit or abampere; 1.000165 International amperes (U. S. 1948); 2.99796$\times10^{9}$ electrostatic cgs units or statamperes

Electromagnetic cgs unit or abampere.—10.0000 amperes (absolute); 2 99796$\times10^{10}$ electrostatic cgs units or statamperes.

Electrostatic cgs unit or statampere.—3.33560$\times10^{-11}$ electromagnetic cgs unit or abampere; 3.33560$\times10^{-10}$ ampere (absolute)

Faraday per second —9.6500$\times10^{4}$ ampere (absolute).

International ampere (U. S. 1948).—0.999835 ampere (absolute).

International ampere (a) —Based on the deposit of 0 00111800 grams of silver per second; 0 99993 ampere (absolute)

International ampere (v) —As defined by the International ohm and volt, 0 99990 ampere (absolute)

International ampere (U S before 1911) —0.99916 International ampere (v)

International ampere (England before 1906) —0 99870 International ampere (v)

International ampere (England 1906-8).—0.99894 International ampere (v)

International ampere (England 1909-10) —0.99990 International ampere (v)

International ampere (France before 1911).—0.9998 International ampere (v)

International ampere (Germany before 1911).—0.99968 International ampere (v)

Statampere.—*See* electrostatic cgs unit

Electrical Field Strength $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{-\frac{1}{2}}t^{-1}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-2}]$

Electrostatic cgs unit of potential per centimeter.—299.796 volts per centimeter (absolute).

Electrostatic cgs unit of potential per inch.—118.05 volts per centimeter (absolute).

Electromagnetic cgs unit of potential per centimeter.—1.0000 $\times 10^{-8}$ volt per centimeter (absolute).

Electromagnetic cgs unit of potential per inch.—3.9370$\times 10^{-9}$ volt per centimeter (absolute).

Volt per inch.—0.39370 volt per centimeter.

Potential $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{3}{2}}t^{-2}]$

Abvolt.—*See* electromagnetic cgs unit.

Electromagnetic cgs unit or abvolt.—3.33560$\times 10^{-11}$ electrostatic cgs unit or statvolt; 1.0000$\times 10^{-8}$ volt (absolute).

Electrostatic cgs unit or statvolt.—299.796 volts (absolute); 2.99796$\times 10^{10}$ electromagnetic cgs units or abvolts.

International volt (U. S. 1948).—1.00033 volts (absolute)

International volt (a).—Based on the International ohm and ampere; 1.00045 volts (absolute).

International volt (v).—Based on the acceptance of the electromotive force of a Weston cell at 20 °C as 1.0183 International volts; 1.00042 volts (absolute).

International volt (U. S. before 1911).—0.99916 International volt (v).

International volt (England before 1906).—0.99870 International volt (v).

International volt (England 1906-8).—0.99894 International volt (v).

International volt (England 1909-10).—0.99990 International volt (v).

International volt (Germany and France, before 1911).—0.99968 International volt (v).

Statvolts.—*See* electrostatic cgs unit.

Volt (absolute).—0.0033356 electrostatic cgs unit or statvolts; 0.999670 International volt (U. S. 1948); 1$\times 10^{8}$ electromagnetic cgs units or abvolts.

Resistance [$\epsilon^{-1}l^{-1}t$]; [$\mu l t^{-1}$]

Abohm.—*See* electromagnetic cgs unit.

Board of trade unit (England 1903).—0.9984 International ohm.

Electromagnetic cgs unit or abohm.—1.11263×10^{-21} electrostatic cgs unit or statohm; 1×10^{-15} megohm; 1.0000×10^{-9} ohm (absolute); 0.001 microhm.

Electrostatic cgs unit or statohm.—8.98776×10^{11} ohms (absolute); 8.98776×10^{20} electromagnetic cgs units or abohms.

International ohm.—The resistance of a uniform column of mercury at 0°C, 106.300 centimeters long, having a mass of 14.4521 grams; 1.000495 ohms (absolute); 1.0016 board of trade unit (England 1903); 1.0630 Siemens unit.

International ohm (France before 1911).—0.9999 International ohm.

"Legal ohm" of 1884 (England).—0.99718 International ohm.

Megohm.—1×10^{6} ohms.

Microhm.—1.11263×10^{-18} electrostatic cgs unit or statohm; 1×10^{-12} megohm; 1×10^{-6} ohm; 1000 electromagnetic cgs units or abohms.

Ohm (absolute).—1.11263×10^{-12} electrostatic cgs unit or statohm; 1×10^{-6} megohm (absolute); 0.999505 International ohm; 1×10^{6} microhms (absolute); 1×10^{9} electromagnetic cgs units or abohms.

Siemens unit.—0.94073 International ohm.

Statohm.—*See* electrostatic cgs unit.

Volume Resistivity [$\epsilon^{-1}t$]; [$\mu l^{2}t^{-1}$]

Electromagnetic cgs unit (abohm)-centimeter.—9.99505×10^{-10} International ohm-centimeter; 0.001 microhm-centimeter; 0.0060153 ohm-mil*-foot.

Electrostatic cgs unit-centimeter.—8.98776×10^{11} ohm-centimeters (absolute).

International annealed copper standard (20°C).—Volume resistivity of annealed copper; 1.7241 microhm-centimeters.

International ohm-centimeter.—1.000495 ohm-centimeters (absolute).

Microhm-centimeter.—1.0000×10^{-6} ohm-centimeter; 0.3937 microhm-inch; 6.0153 ohm-mil*-foot; 1000 abohm-centimeters.

---

*The unit thus marked refers to the diameter of a wire of circular cross section.

Microhm-inch.—2.5400 microhm-centimeters.

Ohm-centimeter (absolute).—0.999505 International ohm-centimeter; 1×10^{6} microhm-centimeters.

Ohm inch.—2.5400×10^{6} microhm-centimeters.

Ohm-meter-millimeter².—100.0000 microhm-centimeters.

Ohm-meter-millimeter*.—78.540 microhm-centimeters.

Ohm-mil*-foot.—0.16624 microhm-centimeter; 166.24 electromagnetic cgs unit (abohm) centimeters.

Mass Resistivity $[\epsilon^{-1}ml^{-3}t]$; $[\mu ml^{-1}t^{-1}]$

Electromagnetic cgs unit.—9.9951×10^{-6} International ohm-meter-gram.

Electrostatic cgs unit.—8.9869×10^{15} International ohm-meter-gram.

International ohm-meter-gram.—1.000495 ohm (absolute)-meter-gram.

Ohm (absolute)-meter-gram.—0.999505 International ohm-meter-gram.

Ohm-centimeter-gram.—D† ohm-centimeter; 1.0000×10^{4} ohm-meter-gram.

Ohm-mile-pound.—1.7513×10^{-4} ohm-meter-gram.

Volume Conductivity $[\epsilon t^{-1}]$; $[\mu^{-1}l^{-2}t]$

Electromagnetic cgs unit or abmhos per centimeter cube (ohm^{-1}-centimeter^{-1}).—166.2 mhos per mil* foot; 1000 megmhos per centimeter cube; 1.000495×10^{9} International ohm^{-1}-centimeter^{-1}.

Electrostatic cgs unit.—1.11318×10^{-12} International ohm^{-1}-centimeter^{-1}.

International annealed copper standard (20°C).—0.5800 microhm^{-1}-centimeter^{-1}.

International ohm^{-1}-centimeter^{-1}.—0.999505 ohm^{-1}-centimeter^{-1} (absolute).

Megmhos per centimeter cube.—0.001 abmhos per centimeter cube; 0.1662 mhos per mil* foot; 2.540 megmhos per inch cube; 1 microhm^{-1}-centimeter^{-1}.

---

†D represents the density in grams per centimeter cubed.

*The unit thus marked refers to the diameter of a wire of circular cross section.

Megmhos per inch cube.—0.39370 megmhos per centimeter cube; 1 microhm^{-1}-inch^{-1}.

Mho centimeter cube.—1 ohm^{-1}-centimeter^{-1}.

Microhm^{-1}-centimeter^{-1}.—1.0000×10^6 ohm^{-1}-centimeter^{-1}; 1 megmho per centimeter cube.

Microhm^{-1}-inch^{-1}.—0.39370 microhm^{-1}-centimeter^{-1}; 1 megmho per inch cube.

Ohm^{-1}-centimeter^{-1} (absolute).—1 mho per centimeter cube; 1.000495 International ohm^{-1}-centimeter.$^{-1}$

Ohm^{-1}-inch^{-1}.—3.9370×10^{-7} microhm^{-1}-centimeter^{-1}.

Ohm^{-1} (meter, millimeter*)$^{-1}$.—0.012732 microhm^{-1}-centimeter^{-1}.

Ohm^{-1} (meter, millimeter^2)$^{-1}$.—0.01000 microhm^{-1}-centimeter^{-1}.

Ohm^{-1} (mil, foot)$^{-1}$.—6.0153 microhm^{-1}-centimeter^{-1}.

100% conductivity (20 °C).—0.5800 microhm^{-1}-centimeter^{-1}.

Mass Conductivity [$\epsilon m^{-1} l^3 t^{-1}$]; [$\mu^{-1} m^{-1} l t$]

x per **electromagnetic cgs unit** $= 1.000495 \times 10^5$ x per International ohm-meter-gram.

x per **electrostatic cgs unit** $= 1.1132 \times 10^{-16}$ x per International ohm-meter-gram.

x per **International ohm-meter-gram** $= 0.999505$ x per ohm (absolute)-meter-gram.

x per **ohm (absolute)-meter-gram** $= 1.000495$ x per International ohm-meter-gram.

x per **ohm-centimeter-gram** $= 1.0000 \times 10^{-4}$ x per ohm-meter-gram.

x per **ohm-mile-pound** $= 0.0057100$ x per ohm-meter-gram.

Capacitance [ϵl]; [$\mu^{-1} l^{-1} t^2$]

Electromagnetic cgs unit or abfarad.—1.0000×10^9 farads (absolute); 1×10^{15} microfarads; 8.98776×10^{20} electrostatic cgs units or statfarads.

---

*The unit thus marked refers to the diameter of a wire of circular cross section.

Electrostatic cgs unit (statfarad or centimeter).—1.11263×10^{-21} electromagnetic cgs unit or abfarad; 1.11263×10^{-12} farad (absolute); 1.11263×10^{-6} microfarad.

Farad (absolute).—1×10^{-9} electromagnetic cgs unit or abfarad; 1.000495 International farad; 1×10^{6} microfarads; 8.98776×10^{11} electrostatic cgs units or statfarads.

International farad.—0.999505 farad (absolute).

Microfarad.—1×10^{-15} electromagnetic cgs unit or abfarad; 1×10^{-6} farad; 8.98776×10^{5} electrostatic cgs units or statfarads.

Micromicrofarad.—1×10^{-12} farad.

Statfarad.—*See* electrostatic cgs unit.

Inductance $[\epsilon^{-1} l^{-1} t^{2}]$; $[\mu l]$

Abhenry.—*See* electromagnetic cgs unit.

Electromagnetic cgs unit (abhenry or centimeter).—1.11263×10^{-21} electrostatic cgs unit or stathenry; 1.0000×10^{-9} henry (absolute); 1×10^{-6} millihenry.

Electrostatic cgs unit or stathenry.—8.98776×10^{11} henry (absolute); 8.98776×10^{14} millihenries; 8.98776×10^{20} abhenries.

Henry (absolute).—1.11263×10^{-12} electrostatic cgs unit or stathenry; 0.999505 International henry; 1000 millihenries; 1×10^{9} electromagnetic cgs units or abhenries.

International henry.—1.000495 henry (absolute).

Millihenry.—1.11263×10^{-15} stathenry; 0.001 henries; 1×10^{6} abhenries.

Stathenry.—*See* electrostatic cgs unit.

Thermoelectric Units

THERMOELECTRIC POWER $[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1} \theta^{-1}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{3}{2}} t^{-2} \theta^{-1}]$

Electromagnetic cgs unit of potential per °C.—0.010000 microvolt per °C (absolute).

Electromagnetic cgs unit of potential per °F.—0.018000 microvolt per °C (absolute).

Electrostatic cgs unit of potential per °C.—2.9986×10^{8} microvolt per °C (absolute).

Electrostatic cgs unit of potential per °F.—5.3975×10^{8} microvolt per °C (absolute).

Microvolt per °F.—1.8000 microvolt per °C.

PELTIER COEFFICIENT $[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{3}{2}} t^{-2}]$

Calorie (15 °C) per ampere-hour.—0.011625 joule per electromagnetic unit quantity.

Calorie (15 °C) per coulomb.—41.850 joules per electromagnetic unit quantity.

Joule per ampere-hour (absolute).—9.2636×10^{-14} joule per electrostatic unit quantity; 0.0027778 joule per electromagnetic unit quantity.

Joule per coulomb.—10.000 joules per electromagnetic unit quantity.

Joule per electron.—6.2811×10^{19} joules per electromagnetic unit quantity.

Joule per faraday.—1.0363×10^{-4} joule per electromagnetic unit quantity.

COEFFICIENT OF THOMSON EFFECT

$[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}\ \theta^{-1}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} t^{-2}\ \theta^{-1}]$

Joule per coulomb per °F.—1.8000 joules per coulomb per °C

Joule per electromagnetic unit quantity per °F.—0.1800 joule per coulomb per °C.

Joule per electron per °C.—6.2811×10^{18} joules per coulomb per °C.

Joule per electrostatic unit quantity per °C.—2.9986×10^{9} joules per coulomb per °C.

Joule per electrostatic unit quantity per °F.—5.3975×10^{9} joules per coulomb per °C.

Joule per faraday per °C.—1.0363×10^{-5} joule per coulomb per °C.

Volt per °C.—1.0000 joule per coulomb per °C.

Piezoelectric Constant $[\epsilon^{\frac{1}{2}} m^{-\frac{1}{2}} l^{\frac{1}{2}} t]$; $[\mu^{-\frac{1}{2}} m^{-\frac{1}{2}} l^{-\frac{1}{2}} t^2]$

Coulomb per kilogram weight.—3057.7 electrostatic unit quantity per dyne.

Electromagnetic unit quantity per kilogram weight.—3.0577×10^4 electrostatic unit quantity per dyne.

Electromagnetic unit quantity per pound weight—6.7411×10^4 electrostatic unit quantity per dyne.

Electron per kilogram weight.—4.868 $\times 10^{-16}$ electrostatic unit quantity per dyne.

Electrostatic unit quantity per kilogram weight.—1.0197 $\times 10^{-6}$ electrostatic unit quantity per dyne.

Electrostatic unit quantity per pound weight.—2.2481 $\times 10^{-6}$ electrostatic unit quantity per dyne.

Faraday per kilogram weight.—2.9507 $\times 10^{8}$ electrostatic unit quantity per dyne.

Flux of Magnetic Induction; Magnetic Flux; Pole Strength

$$[\epsilon^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}];\ [\mu^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{3}{2}}\ t^{-1}]$$

Electromagnetic cgs unit (unit pole).—4π maxwell (absolute).

Electrostatic cgs unit.—2.99796 $\times 10^{10}$ maxwells (absolute).

International maxwell (U. S. 1948).—1.00033 maxwells (absolute).

Kilolines.—1000 maxwells.

Line.—1.0000 maxwell (absolute).

Maxwell (absolute).—3.3356 $\times 10^{-11}$ electrostatic cgs unit; 0.999670 International maxwell; 1.0000 line.

Megaline.—1 $\times 10^{6}$ maxwells.

Volt-second.—1 $\times 10^{8}$ maxwells.

Weber.—1 volt-second; 1 $\times 10^{8}$ maxwells.

Magnetic Field Intensity $[\epsilon^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}\ t^{-2}];\ [\mu^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{-\frac{1}{2}}\ t^{-1}]$

The name oersted was given to the unit of field intensity formerly known and given below as the gauss, by the International Electrotechnical Commission in 1930.

Ampere-turn per centimeter.—1.2566 gauss.

Ampere-turn per inch.—0.49474 gauss.

Electromagnetic cgs unit.—1.0000 gauss (absolute).

Electrostatic cgs unit.—3.33560 $\times 10^{-11}$ gauss (absolute).

Gamma (γ).—1.0000 $\times 10^{-5}$ gauss.

Gauss (absolute.)—0.79580 ampere-turn per centimeter; 1 electromagnetic cgs unit; 1 gilbert per centimeter; 1.000165 International gauss; 2.0213 ampere-turns per inch; 6.452 lines per square inch; 1 $\times 10^{5}$ gamma (γ); 2.99796 $\times 10^{10}$ electrostatic cgs units.

Gilbert per centimeter.—1.0000 gauss; 2.021 ampere-turns per inch.

International gauss (U. S. 1948).—0.999835 gauss (absolute).

Lines per square centimeter.—1 gauss.

Lines per square inch.—0.1550 gauss.

Magnetomotive Force; Magnetic Potential

$[\epsilon^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{3}{2}}\ t^{-2}]$; $[\mu^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}\ t^{-1}]$

Abampere-turn.—10 ampere-turns; 12.566 gilberts.

Ampere-turn.—0.1 abampere-turn; 1.2566 gilberts.

Electromagnetic cgs unit.—1.00000 gilbert (absolute).

Electrostatic cgs unit.—3.33560 × 10^{-11} gilbert (absolute).

Gilbert (**absolute**).—0.07958 abampere-turn; 0.7958 ampere-turn; 1.000165 International gilbert.

Reluctance $[\epsilon\ l\ t^{-2}]$; $[\mu^{-1}\ l^{-1}]$

Since 1930 oersted has been used as the name for magnetic field intensity. The oersted as used below is equivalent to one ampere-turn per maxwell.

Electromagnetic cgs unit.—1.0000 oersted (absolute).

Electrostatic cgs unit.—1.1122 × 10^{-21} oersted (absolute).

International oersted.—0.999505 oersted (absolute).

Oersted (**absolute**).—1.000495 International oersted.

Magnetic Induction; Intensity of Magnetization

$[\epsilon^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{-\frac{3}{2}}]$; $[\mu^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{-\frac{1}{2}}\ t^{-1}]$

Since 1930 the name gauss has been used for unit magnetic induction, one maxwell per square centimeter.

Electromagnetic cgs unit.—1.00000 maxwell (absolute) per square centimeter.

Electrostatic cgs unit.—2.9986 × 10^{10} maxwells (absolute) per square centimeter.

International maxwell per square centimeter.—1.00033 maxwells (absolute) per square centimeter.

Line per square centimeter.—1.00000 maxwell per square centimeter.

Line per square inch.—0.15500 maxwell per square centimeter.

Maxwell per square centimeter (absolute).—0.999670 International maxwell per square centimeter.

Maxwell per square inch.—0.15500 maxwell per square centimeter.

Dielectric Constant; Electrical Inductivity; Magnetic Permeability; Susceptibility.

Electromagnetic cgs unit.—8.9916×10^{20} electrostatic cgs units.

Foot-pound-second electromagnetic unit.—0.0010764 electromagnetic cgs unit; 9.6784×10^{17} electrostatic cgs units.

Foot-pound-second-electrostatic unit.—1.0000 electrostatic cgs unit.

Magnetic Effects

COEFFICIENT OF LEDUC EFFECT $[\epsilon^{-\frac{1}{2}} m^{-\frac{1}{2}} l^{-\frac{1}{2}} t^2]$; $[\mu^{\frac{1}{2}} m^{-\frac{1}{2}} l^{\frac{1}{2}} t]$

x centimeters per **ampere-turn**$=0.79577$ x per gauss.

x centimeters per **gilbert**$=1.0000$ x per gauss.

x per **electrostatic cgs unit**$=2.9986\times10^{10}$ x per gauss.

x inches per **ampere-turn**$=2.0213$ x per gauss.

COEFFICIENT OF HALL EFFECT $[\epsilon^{-\frac{3}{2}} m^{-\frac{1}{2}} l^{-\frac{1}{2}} t^3]$; $[\mu^{\frac{1}{2}} m^{-\frac{1}{2}} l^{\frac{5}{2}}]$

Electrostatic cgs unit.—2.6962×10^{31} electromagnetic cgs unit.

Volt centimeter per ampere gauss (absolute).—1.0000×10^{9} electromagnetic cgs unit.

Volt inch per ampere gauss (absolute).—2.5400×10^{9} electromagnetic cgs unit.

COEFFICIENT OF ETTINGHAUSEN EFFECT $[\epsilon^{-1} m^{-1} l^{-1} t^4 \theta]$; $[\mu m^{-1} l t^2 \theta]$

°C centimeter per ampere gauss (absolute).—10.000 °C centimeter per electromagnetic cgs unit.

°C centimeter per electrostatic cgs unit.—8.9916×10^{20} °C centimeter per electromagnetic cgs unit.

°F inch per ampere gauss (absolute).—45.720 °C centimeter per electromagnetic cgs unit.

COEFFICIENT OF NERNST EFFECT $[\epsilon^{-1}\, t\, \theta^{-1}]$; $[\mu l^2\, t^{-1}\, \theta^{-1}]$

Electrostatic cgs unit per °C.—8.9916×10^{20} electromagnetic cgs unit per °C.

Volt per gauss °C (absolute).—1.0000×10^8 electromagnetic cgs unit per °C.

Volt per gauss °F (absolute).—1.8000×10^8 electromagnetic cgs unit per °C.

VERDET'S CONSTANT $[\epsilon^{-\frac{1}{2}}\, m^{-\frac{1}{2}}\, l^{-\frac{3}{2}}\, t^2]$; $[\mu^{\frac{1}{2}}\, m^{-\frac{1}{2}}\, l^{-\frac{1}{2}}\, t]$

Minute per ampere-turn.—1.2566 minute per electromagnetic cgs unit.

Minute per gilbert.—1.0000 minute per electromagnetic cgs unit.

Radian per gilbert.—3437.7 minute per electromagnetic cgs unit.

RELATIONS OF ELECTRICAL UNITS

1 ohm $= 10^9$ electromagnetic $= 1/9 \times 10^{-11}$ electrostatic
1 volt $= 10^8$ electromagnetic $= 1/3 \times 10^{-2}$ electrostatic
1 ampere $= 10^{-1}$ electromagnetic $= 3 \times 10^9$ electrostatic
1 coulomb $= 10^{-1}$ electromagnetic $= 3 \times 10^9$ electrostatic
1 farad $= 10^{-9}$ electromagnetic $= 9 \times 10^{11}$ electrostatic
1 farad = 1,000,000 microfarads
1 henry $= 10^9$ electromagnetic $= 1/9 \times 10^{-11}$ electrostatic

VALUE OF THE GAS CONSTANT R FOR VARIOUS UNITS

8.3170×10^7 ergs per °C per mole
1.9869 calories (15°) per °C per mole

Units of pressure	Units of volume.	R per gram molecule.
Atmospheres	Volume at 0° C.	0.003662
Atmospheres	cm³	82.057
Atmospheres	liters	0.082054
Atmospheres	cubic meters	8.2057×10^{-5}
Dynes per cm² [barye]	cm³	8.3144×10^7
Kilograms per m² [g = 980.6]	cm³	8.48×10^5
		R per lb. molecule. °F
Pounds per sq.in.	cu.in.	18510.
Pounds per sq.in.	cu.ft.	10.73
Atmospheres	cu.in.	1260
Atmospheres	cu.ft.	0.7302

FACTORS FOR CONVERSION OF ENERGY UNITS

(From Perkins' Introduction to General Thermodynamics, John Wiley & Sons, publishers, by permission.)

	Gram-calories (4° C)	B.T.U.*	Joules	Foot-pounds	Kilogr.-meters	Liter-atmos.	Cu.ft.-atmos.	Foot-poundals	Horse-power hours

LENGTHS – CENTIMETERS TO INCHES

0.1 *to* 100 *Units*

1 centimeter = 0.393700 inches

The values found in the body of the table give, in inches, the lengths indicated in centimeters at the top and side.

LENGTHS — METERS TO FEET

From 1 *to* 1,000 *Units*

Reduction factor: 1 meter = 3.280833333 feet

The values found in the body of the table give, in feet, the length indicated in meters at the top and side.

LENGTHS — KILOMETERS TO MILES

From 1 *to* 1,000 *Units*

Reduction factor: 1 kilometer = 0.6213699495 mile

Values found in the body of the table give, in miles, the length indicated in kilometers at the top and side.

CAPACITIES—LITERS TO LIQUID QUARTS

From 1 *to* 1,000 *Units*

Reduction factor: 1 liter = 1.056710 liquid quarts (U. S.)

The values found in the body of the table give, in liquid quarts, the capacities indicated in liters at the top and side.

WEIGHTS — KILOGRAMS TO AVOIRDUPOIS POUNDS

From 1 *to* 1,000 *Units*

Reduction factor: 1 kilogram = 2.204622341 avoirdupois pounds

The values found in the body of the table give, in avoirdupois pounds, the weights indicated in kilograms at the top and side.

To Convert Degrees Fahrenheit to Degrees Centigrade

Use the first table for one of the digits, and the second table for the others; then add.

Examples: To find the Centigrade equivalent for 35.F.

30 = 16.67(2)   30 = −1.11(1)
5 = −15 (1) or,   5 = 2.78(2)
35.F = 1.67.C   35.F = 1.67.C

To find the C. equivalent for 355.F. and 5445.F.

300   148.89(1)
50   27.78(2) or,
5   2.78(2)
355.F   179.45.C.

CONVERSION OF THERMOMETER SCALES (Continued)

300	166.67(2)	5000	2760 (1)
50	10 (1)	400	222.22(2)
5	2.78(2)	40	22.22(2)
355.F. =	179.45.C.	5	2.78(2)
		5445.F. =	3007.22.C.

FIXED POINTS FOR LOW TEMPERATURES (0°C TAKEN AS 273.16° KELVIN)

Material	Change of state	C°	T° Kelvin	$\frac{1000}{T}$
Water	m	0	273.16	3.66086
Carbon tetrachloride	m	− 22.9	250.26	3.99584
Ammonia	b	− 33.4	239.76	4.17084
Mercury	m	− 38.9	234.26	4.26876
Chlorobenzene	m	− 45.6	227.56	4.39445
Chloroform	m	− 64.2	208.96	4.78560
Carbon dioxide	s	− 78.5	194.66	5.13716
Ethyl acetate	m	− 83.6	189.56	5.27537
Toluene	m	− 95.7	177.46	5.63507
Methyl cyclohexane	m	−126.3	146.86	6.80921
Methyl cyclopentane	m	−140.5	132.66	7.53807
Oxygen	b	−183.0	90.16	11.09139
Nitrogen	b	−195.8	77.36	12.92658

m = melting point: solid-liquid equilibrium.
b = boiling point: liquid-vapor equilibrium (760 mm).
s = sublimation point: solid-vapor equilibrium (760 mm).

TEMPERATURES — CENTIGRADE TO FAHRENHEIT

Conversion Table

The values in the body of the table give, in degrees Fahrenheit, the temperatures indicated in degrees Centigrade at the top and side.

1° C. = 1.8° F.

For temperatures below 0° C.

Temp. °C.	0	1	2	3	4	5	6	7	8	9
0	+ 32.0	30.2	28.4	26.6	24.8	23.0	21.2	19.4	17.6	15.8

MOMENT OF INERTIA FOR VARIOUS BODIES

The mass of the body is indicated by m.

Body	Axis	Moment of inertia
Uniform thin rod	Normal to the length, at one end	$m\frac{l^2}{3}$
Uniform thin rod	Normal to the length, at the center	$m\frac{l^2}{12}$
Thin rectangular sheet, sides a and b	Through the center parallel to b	$m\frac{a^2}{12}$
Thin rectangular sheet, sides a and b	Through the center perpendicular to the sheet	$m\frac{a^2+b^2}{12}$
Thin circular sheet of radius r	Normal to the plate through the center	$m\frac{r^2}{2}$
Thin circular sheet of radius r	Along any diameter	$m\frac{r^2}{4}$
Thin circular ring. Plane figure formed by two concentric circles of radius r_1 and r_2	Through center normal to plane of ring	$m\frac{r_1^2+r_2^2}{2}$
Thin circular ring. Plane figure formed by two concentric circles of radius, r_1 and r_2	Any diameter	$m\frac{r_1^2+r_2^2}{4}$
Rectangular parallelopiped, edges a, b, and c	Through center perpendicular to face ab, (parallel to edge c)	$m\frac{a^2+b^2}{12}$
Sphere, radius r	Any diameter	$m\frac{2}{5}r^2$
Spherical shell, external radius, r_1 internal, radius r_2	Any diameter	$m\frac{2}{5}\frac{(r_1^5-r_2^5)}{(r_1^3-r_2^3)}$

MOMENT OF INERTIA FOR VARIOUS BODIES (Continued)

The mass of the body is indicated by m.

Body	Axis	Moment of inertia
Spherical shell, very thin, mean radius, r	Any diameter	$m\frac{2r^2}{3}$
Right circular cylinder (or disk) of radius r	The longitudinal axis of the solid (central axis perpendicular to circular section of disk)	$m\frac{r^2}{2}$
Right circular cylinder of radius r, length l	Through center perpendicular to the axis of the figure, (transverse diameter)	$m\left(\frac{r^2}{4}+\frac{l^2}{12}\right)$
Hollow circular cylinder, length l, external radius r_1 internal radius r_2	The longitudinal axis of the figure	$m\frac{(r_1^2+r_2^2)}{2}$
Thin cylindrical shell, length l, mean radius, r	The longitudinal axis of the figure	mr^2
Hollow circular cylinder, length l, external radius r_1, internal radius r_2	Transverse diameter	$m\left[\frac{r_1^2+r_2^2}{4}+\frac{l^2}{12}\right]$
Hollow circular cylinder, length l, very thin, mean radius r	Transverse diameter	$m\left(\frac{r^2}{2}+\frac{l^2}{12}\right)$
Elliptic cylinder, length l, transverse semiaxes a and b	Longitudinal axis	$m\left(\frac{a^2+b^2}{4}\right)$
Right cone, altitude h, radius of base r	Axis of the figure	$m\frac{3}{10}r^2$
Spheroid of revolution, equatorial radius r	Polar axis	$m\frac{2r^2}{5}$
Ellipsoid, axes $2a$, $2b$, $2c$	Axis $2a$	$m\frac{(b^2+c^2)}{5}$

RADIO FORMULÆ

A collection of formulae useful in the computation of inductance, capacitance, and other constants of oscillating circuits. From Radio Instruments and Measurements, Bureau of Standards.

CAPACITANCE

Units.—In the following formulæ all lengths are expressed in centimeters, areas in square centimeters; the dielectric constant K, is taken as unity for air. Capacitances will be given in micromicrofarads = 10^{-12} farads. The electrostatic unit of capacitance, sometimes called the centimeter = 1.1124 micromicrofarads.

Parallel plate condenser.—If s be the area of one plate: t, the thickness of the dielectric; K, the dielectric constant; and N, the number of plates,—the capacitance

$$C = 0.0885\, K \frac{(N-1)s}{t}.$$

Variable condenser, semicircular plates.—Where N is the total number of parallel plates; r_1 the outer, and r_2 the inner radius of the plates; t, the thickness of the dielectric, and K the dielectric constant,—the maximum capacitance is given by

$$C = 0.1390 K \frac{(N-1)(r_1^2 - r_2^2)}{t}.$$

Isolated thin circular disk. — If d is the diameter of the disk

$$C = 0.354d.$$

Isolated sphere. — If d is the diameter of the sphere

$$C = 0.556d.$$

Two concentric spheres. — If r_1 is the radius of the outer sphere; r_2, that of the inner sphere; K, the dielectric constant of the material between the spheres,

$$C = 1.112K \frac{r_1 r_2}{r_1 - r_2}.$$

Two coaxial cylinders. — If r_1 is the radius of the outer cylinder; r_2, that of the inner; l, the length of the cylinders; K, the dielectric constant,

$$C = K \frac{0.2416\, l}{\log_{10} \frac{r_1}{r_2}}.$$

Single long wire parallel to the ground. — For a wire of length l; diameter, d; suspended at a height h above the ground, where the diameter is small compared with the length, For $\frac{4h}{l} = \text{or} < 1$ $$C = \frac{0.2416\, l}{\log_{10} \frac{4h}{d} - k_1}$$

For $\frac{l}{4h} = \text{or} < 1$ $$C = \frac{0.2416\, l}{\log_{10} \frac{2\,l}{d} - k_2}$$

In which,

$$k_1 = \log_{10} \left[\frac{1 + \sqrt{1 + \left(\frac{4h}{l}\right)^2}}{2} \right] \qquad k_2 = \log_{10} \left[\frac{l}{4h} + \sqrt{1 + \left(\frac{l}{4h}\right)^2} \right]$$

the values of which may be found in a table at the end of this section.

Vertical wire. — For a wire of length l, relatively high above the ground; of diameter d, the approximate capacitance is as follows,

$$C = \frac{0.2416\, l}{\log_{10} \frac{2l}{d}}.$$

Two horizontal parallel wires at the same height. — If d is the diameter of each wire; l, the length of each; h, the height above the ground; D, the distance between wires, — where d and D are small compared to l,

$$C = \frac{0.1208\, l}{\log_{10} \frac{2D}{d} - \frac{D^2}{8h^2}}.$$

Two parallel horizontal wires, one above the other. — Use the preceding formula for parallel wires at the same height, substituting the mean height for h.

Two parallel wires joined together, both at the same height. — Let l be the length of each wire; D, the distance between centers; h, the height above the ground; d_2 the diameter of cross section of the wire. If d^2 and D^2 are small compared with l^2 and $4h^2$ respectively

For $\frac{4h}{l} = \text{or} < 1$ $$C = \frac{0.4831\, l}{\log_{10} \frac{4h}{d} + \log_{10} \frac{2h}{D} - 2k_1}.$$

For $\frac{l}{4h} = \text{or} < 1$ $$C = \frac{0.4831 l}{\log_{10} \frac{2l}{d} + \log_{10} \frac{l}{D} - 2k_2}.$$

k_1 and k_2 have the same significance as above and may be found from the tables at the end of the section.

Several wires in parallel.—If n parallel wires are joined together; D, the spacing between the wires; d, the diameter of the wire; h, the height above the ground; l, the length of the group,—the approximate capacitance is,

$$C = \frac{1.112\,l}{\dfrac{p_{11} + (n-1)p_{12}}{n} - k}.$$

p_{11} and p_{12} may be computed from the following:

For $\dfrac{4h}{l} = \text{or} < 1$

$$p_{11} = 4.605\left[\log_{10}\frac{4h}{d} - k_1\right]$$

$$p_{12} = 4.605\left[\log_{10}\frac{2h}{D} - k_1\right]$$

For $\dfrac{l}{4h} = \text{or} < 1$

$$p_{11} = 4.605\left[\log_{10}\frac{2l}{d} - k_2\right]$$

$$p_{12} = 4.605\left[\log_{10}\frac{l}{D} - k_2\right]$$

Values of k, k_1, k_2 may be found in the following table.

TABLE 1

$\frac{4h}{l}$	k_1	$\frac{l}{4h}$	k_2	n	k	n	k

INDUCTANCE

Units. — In the following formulæ all lengths are expressed in centimeters. The inductance calculated will be in microhenries = 10^{-6} henry.

Long straight round wire. — If l is the length; d, the diameter of cross section; μ the permeability of the material, — the inductance at zero or low frequency is,

$$L = 0.002\,l\left[2.303\log_{10}\frac{4l}{d} - 1 + \frac{\mu}{4}\right]$$

For all except iron wire $\mu = 1$ and the last term becomes 0.25. For wires whose length is less than about 1000 times the diameter the term $+\frac{d}{2l}$ should be added inside the brackets.

For any frequency:

$$L = 0.002\,l\left[2.303 \log_{10} \frac{4l}{d} - 1 + \mu\delta\right]$$

where δ is a quantity given in Table 2 below as a function of x. x is to be computed from the relation

$$x = 0.1405 d\sqrt{\frac{\mu f}{\rho}}$$

where d and μ are as above; f, the frequency and ρ the resistivity of the material of the wire expressed in microhm-centimeters. (See Properties of Metallic Conductors.)

For copper at 20° C.

$$x = 0.1071\, d\sqrt{f}.$$

For wires other than iron, whose length is 100,000 times the diameter the inductance at infinite frequency is about 2% less than at zero frequency.

TABLE 2

Values of δ for computing inductance at any frequency.

x	δ	x	δ
0	0.250	12	0.059
0.5	.250	14	.050
1.0	.249	16	.044

8.0	.088	100	.007
9.0	.078	∞	.000
10.0	.070		

Two parallel round wires, return circuit.—If l is the length of each wire; d, the diameter; D, the distance between centers of wires; μ the permeability,—the inductance for any frequency is

$$L=0.004\,l\left[2.303\log_{10}\frac{2D}{d}-\frac{D}{l}+\mu\delta\right]$$

where δ is a quantity to be obtained from the table above as a function of x which is to be computed as explained for the previous formula.

For copper and at low frequency the term δ becomes 0.25.

Square of round wire.—If a is the length of the side of the square; d, the diameter of the wire; μ the permeability, the inductance for any frequency is,

$$L=0.008a\left[2.303\log_{10}\frac{2a}{d}+\frac{d}{2a}-0.774+\mu\delta\right]$$

where δ is obtained as above. For low frequency and for wires other than iron δ becomes 0.25; for infinite frequency the value is zero.

Grounded horizontal wire, the Earth acting as return circuit. If l is the length of wire; h, the height above the ground; l, the diameter of the wire; μ the permeability and δ the frequency constant (see table 2), the inductance,—where d is small compared with l,—is given as follows:

For $\frac{2h}{l}$ =or <1 $\qquad L=0.002\,l\left[2.3026\log_{10}\frac{4h}{d}-P+\mu\delta\right]$

For $\frac{l}{2h}$ =or <1 $\qquad L=0.002\,l\left[2.3026\log_{10}\frac{4\,l}{d}-Q+\mu\delta\right]$

P and Q may be found in the following table.

TABLE 3

$\frac{2h}{l}$	P	$\frac{l}{2h}$	Q	$\frac{2h}{l}$	P	$\frac{l}{2h}$	Q
0	0	0	1.0000	0.6	0.5136	0.6	1.2918
0.1	0.0975	0.1	1.0499	.7	.5840	.7	1.3373
.2	.1900	.2	1.0997	.8	.6507	.8	1.3819
.3	.2778	.3	1.1489	.9	.7139	.9	1.4251
.4	.3608	.4	1.1975	1.0	.7740	1.0	1.4672
.5	.4393	.5	1.2452	.....	....	.....	....

The mutual inductance of the case above may be expressed, For $\frac{2h}{l} = \text{or} < 1$ $\quad M = 0.002\,l\left[2.3026 \log_{10}\frac{2h}{D} - P + \frac{D}{l}\right]$

For $\frac{l}{2h} = \text{or} < 1$ $\quad M = 0.002\,l\left[2.3026 \log_{10}\frac{2l}{D} - Q + \frac{D}{l}\right]$

The values of P and Q are found in the table above.

Grounded wires in parallel. — Compute by the above formulae the inductance L_1 per unit length of a single wire and the mutual inductance M_1 per unit length of two adjacent wires, using the actual length in determining the ratios $\frac{2h}{l}$, $\frac{2l}{d}$ etc. Then the inductance of n parallel wires will be,

$$L = l\left[\frac{L_1 + (n-1)M_1}{n} - 0.001k\right]$$

where k is a function of n found in Table 1 under capacity formulae.

Circular ring of round wire. — If a is the mean radius of the ring; d, the diameter of the wire, the inductance at any frequency is

$$L = 0.01257a\left[2.303 \log_{10}\frac{16a}{d} - 2 + \mu\delta\right]$$

where δ is determined from the table above.

Circular coil of circular cross section. — For a coil of n fine wires wound with mean radius of the turns a, the cross section of whose winding is a circle of diameter d, the inductance at low frequency, for wire other than iron, neglecting insulation space is,

$$L = 0.01257an^2\left[2.303 \log_{10}\frac{16a}{d} - 1.75\right]$$

Torus with a single layer transverse winding, — a circular solenoid of circular cross section. If r is the distance from the center of the torus to the center of the transverse section; a, the radius of the turns of the winding; n, the number of turns, the inductance at low frequency is

$$L = 0.01257n^2\left[r - \sqrt{r^2 - a^2}\right]$$

Solenoid, single layer. If n is the number of turns; a the radius of the coil; b, the length, the approximate inductance at any frequency is,

$$L = \frac{0.03948a^2n^2}{b}K$$

where K is a function of $\frac{2a}{b}$ given in the table below.

TABLE 4

Long multiple layer solenoid. — The inductance is given approximately by,

$$L = L_1 - \frac{0.01257 n^2 ac}{b}(0.693 + B_s)$$

where L_1 is the inductance calculated from the formula for a single layer solenoid, n being the number of turns of the winding; a, the radius of the coil measured from the axis to the center of the cross section of the winding; b, the length of the coil; c, the radial depth of the winding; B_s a correction given in table below as a function of b/c.

TABLE 5

b/c	B_s	b/c	B_s
1	0.0000	16	0.3017
2	.1202	17	.3041
3	.1753	18	.3062

15	.2991	30	.3218

Square coil of rectangular cross section. — If a be the side of the square measured to the center of the rectangular section which has sides b and c and if n be the number of turns,

$$L = 0.008an^2\left[2.303 \log_{10} \frac{a}{b+c} + 0.2235 \frac{b+c}{a} + 0.726\right]$$

If the cross section is a square $b = c$ and the expression becomes

$$L = 0.008an^2\left[2.303 \log_{10} \frac{a}{b} + 0.447 \frac{b}{a} + 0.033\right]$$

MUTUAL INDUCTANCE

Two parallel wires. — If l be the length of each wire; D. the distance between, the inductance is

$$M = 0.002\, l\left[2.303 \log_{10} \frac{2l}{D} - 1 + \frac{D}{l}\right]$$

Coaxial solenoids, single layer coils, not concentric. If a is the radius of the smaller coil; A, the radius of the larger: n_1 and n_2 the number of turns on the smaller and larger coil respectively; $2l$ the length of the smaller coil; $2x$, the length of the larger; D, the distance between the centers of the coils measured along the common axis,

$$M = 0.009870\frac{a^2A^2n_1n_2}{2x.2\,l}\left[K_1k_1 + K_3k_3 + K_5k_5\right]$$

where

$$K_1 = \frac{2}{A^2}\left(\frac{x_2}{r_2} - \frac{x_1}{r_1}\right) \qquad k_1 = 2\,l$$

$$K_3 = \frac{1}{2}\left(\frac{x_1}{r_1^5} - \frac{x_2}{r_2^5}\right) \qquad k_3 = a^2\,l\left(3 - 4\frac{l^2}{a^2}\right)$$

$$K_5 = -\frac{A^2}{8}\left[\frac{x_1}{r_1^9}\left(3 - 4\frac{x_1^2}{A^2}\right) - \frac{x_2}{r_2^9}\left(3 - 4\frac{x_2^2}{A^2}\right)\right]$$

$$k_5 = a^4\,l\left(\frac{5}{2} - 10\frac{l^2}{a^2} + 4\frac{l^4}{a^4}\right)$$

where

$$x_1 = D - x \qquad r_1 = \sqrt{x_1^2 + A^2}$$

$$x_2 = D + x \qquad r_2 = \sqrt{x_2^2 + A^2}$$

The above is most accurate for short coils with relatively great distance between.

Coaxial, concentric solenoids, outer coil the longer. If a be the radius of the smaller coil; A, that of the larger; $2l$, the length of the inner coil; $2x$, the length of the outer; n_1 and n_2 the number of turns on the inner and outer coil respectively,

$$M = \frac{0.01974a^2n_1n_2}{g}\left[1 + \frac{A^2a^2}{8g^4}\left(3 - 4\frac{l^2}{a^2}\right)\right]$$

where $g = \sqrt{x^2 + A^2}.$

Coaxial, concentric solenoids, outer coil the shorter. Assuming the symbols as before except

$$g = \sqrt{l^2 + A^2}$$

$$M = 0.01974\frac{a^2n_1n_2}{g}\left[1 + \frac{A^2a^2}{8g^4}\left(3 - 4\frac{x^2}{a^2}\right)\right]$$

HIGH FREQUENCY RESISTANCE

Cylindrical straight wires.—The ratio R/R_0 of the high frequency resistance to the resistance at low frequency may be found from the table below, by calculating first the value of x from the relation,

$$x = \pi d\sqrt{\frac{2\mu f}{\rho}}\sqrt{\frac{1}{1000}}$$

where d is the diameter of the wire in centimeters; μ, the magnetic permeability; f, the frequency; ρ, the resistivity in microhm-centimeters.

RADIO FORMULAE (Continued)

For copper wire $x = 10da$ where a has a value given by $a = 0.01071\sqrt{f}$. The value of a for various frequencies may be found in the second of the two tables below. The above method gives the high-frequency resistance of simple circuits of any shape where the length is great compared with the diameter of the wire and the different portions of the circuit are not close to each other.

TABLE 6

Ratio of High-Frequency Resistance to the Direct-Current Resistance.

5.0	2.043	13.5	5.033	.....	......

As an extension of the above table the following relation may be used:

$$R/R_0 = x/2.828 + 0.25.$$

The equation is valid for values of x greater than 7 at which point the error is about 1 % and decreasing with increasing values of x.

WAVE LENGTH

The wave length in meters is given by the following expression when L, the inductance, is in microhenries and C, the capacitance, is in microfarads. The resistance is assumed negligible.

$$\lambda = 1884\sqrt{LC}$$

VALUES OF "L C"

Compiled by Doctor P. L. Bayley

The following table gives values of the product of the inductance and capacitance (L C).

Key for Locating the Decimal Point for Expanded Ranges of "L C"

λ in meters	f in kilocycles per sec.	L C in microhenries × microfarads	
1	299,793	0.000,000,280,837

VALUES OF ω AND $1/\omega^2$

Computed by C. W. Winkler,
submitted by J. Johnsen

The values for ω were computed to 9 significant figures and rounded to 8. These values, in the range 100 to 1000 kc, were obtained by adding the common difference $2\pi \times 10^{-2}$ for intervals of 1 kc. Every fifth entry was checked by adding $\pi \times 10^{-1}$ to the previous key entry. Values from 1000 to 2000 kc were obtained in the same way except the common difference here is $2\pi \times 10^{-3}$. The values for $1/\omega^2$ were obtained by taking the reciprocal of the squared values of ω and were checked with some previously computed tables.

EXTENSION OF TABLES

Let the tabulated value for ω be M. The range of the tables may be extended as follows:

Frequency	ω	$1/\omega^2$
5 cycles	$M \times 10^{-5}$	$M \times 10^{10}$
50 cycles	$M \times 10^{-4}$	$M \times 10^{8}$
500 cycles	$M \times 10^{-3}$	$M \times 10^{6}$
5 kc	$M \times 10^{-2}$	$M \times 10^{4}$
50 kc	$M \times 10^{-1}$	$M \times 10^{2}$
500 kc	M	M
5 mc	$M \times 10$	$M \times 10^{-2}$
50 mc	$M \times 10^{2}$	$M \times 10^{-4}$
500 mc	$M \times 10^{3}$	$M \times 10^{-6}$
5000 mc	$M \times 10^{4}$	$M \times 10^{-8}$

LABORATORY ARTS AND RECIPES

Many of the following recipes have been contributed by users of the Handbook. To those who have cooperated in this way we extend our grateful acknowledgment.

BLUING STEEL AND IRON

The metal is cleaned with a potassium bichromate-sulfuric acid mixture, then washed with ammonium hydroxide and rubbed dry. Apply ammonium polysulfide until the desired depth of color is obtained, allowing the object to dry after each application and rubbing briskly with soft clean cloth. The result is a deep blue which may be made very nearly black by repeated applications. Rubbing with boiled linseed oil will deepen this color more. The finish thus obtained is very resistant to oxidation.

CEMENTS AND ADHESIVES

Acid Proof Cement

1

A handy acid resisting cement can be made by mixing sodium silicate and asbestos powder to the consistency of a thin paste. If allowed to dry for a day, the resulting cement will resist the strongest acids.

2

Barium sulfate 4 parts, water glass 3 parts, asbestos 1 part. Sodium fluosilicate or sodium fluoborate is advised in addition when the cement is used on glass.

Aquarium Cement

1

Glazier's putty	10 lb.
Litharge	1 lb.
Red lead	1 lb.
Asphaltum	4 oz. fl.

Mix with boiled linseed oil to the proper consistency. Lamp black may be added to give a gray color.

2

Red lead	3 parts
Litharge	7 parts
Fine sand	10 parts
Powdered rosin	1 part

Add sufficient spar varnish to give the proper consistency.

Cement for Cellophane

The following is said to be a very satisfactory glue or cement for cellophane:

Gum acacia (gum arabic)	16.5 parts by weight
Glycerin	29.5 parts by weight
Water	49.5 parts by weight
Formaldehyde (40 %)	4.5 parts by weight

Cupric Oxide Cement

For a strong adhesive cement for attaching metal articles to each other or for cementing glass, a paste of cupric oxide and phosphoric acid is very satisfactory. The cement is adhesive, strong and sets quite rapidly.

De Khotinsky Cement

1

About 70 grams of light brown orange shellac is added in small amounts to 30 grams of heated pine tar. The mixture is stirred at frequent intervals for a period of two hours (or four hours) and maintained at a temperature of 130° C. or slightly lower. (The longer heating period gives a cement that is suitable for high vacuum work.) The product may be tested at intervals by dropping some of it into cold water and then subjecting it to bending pressure. Under such treatment, the product should not bend but break with a conchoidal fracture.

If a harder product is desired, 85 grams of light brown shellac may be mixed and heated with 30 grams of pine tar.

The finished product, while still warm, may be spread on a stone slab or a smooth surface and rolled into small sticks.

This sealing cement will be found useful whenever two pieces of apparatus are to be cemented together. The cementing is effected by warming the surfaces and applying melted cement. The removal of the cement may be facilitated by softening it with alcohol.

2

A handy water-proof laboratory cement of the type "Khotinsky Cement" is made from:

Dry yellow or orange shellac	3 parts by weight
Pine tar	1 part by weight

Place the shellac in a double boiler using water in the outer member. Add the pine tar and permit to digest with occasional stirring until the mass is homogeneous; this will take about five hours. Pull out like taffy and make into sticks. The cement can be made harder or softer by varying the amount of tar.

General Hints

Glues of all kinds are useful for wood, leather, paper and glass, where the joints are not required to be waterproof.

For waterproof joints of nearly all substances, including metals, shellac may be used. Flakes of solid shellac may be used with heat or it may be used as a solution in alcohol.

Khotinsky cement, Chatterton's compound and other resinous cements are used for similar purposes and in the some way as solid shellac. Glass cells made up with compounds of this nature may be made impervious to alcohol by painting over the joints with a rubber cement made by melting up small pieces of rubber tubing and adding carbon disulfide to make a thin syrup.

For celluloid a cement made by dissolving celluloid shavings in acetone is recommended.

Brass fittings are usually cemented on glass tubing with sealing wax. The glass tube should be wound with thread or twine to secure a close fit. The glass and the brass fitting should be warmed slightly above the melting point of wax. (Thick or pressed glass should be warmed slowly.) Wax may be applied to both parts and the thread well saturated with the melted wax. Enough should be used to insure filling the space completely. Join the parts while the wax is very soft and clamp in position until it is thoroughly cold.

For optical purposes, cementing glass, etc., Canada balsam is universally employed, and makes a permanent and nearly invisible joint.

Laboratory Adhesive

Nitrated cotton (5-6 sec.)	30 grams

Make up a solution of:

Di methyl ketone (acetone)	100 milliliters (c.c.)
Amyl acetate	45 milliliters (c.c.)
Butyl acetate	15 milliliters (c.c.)
Ethyl acetate	15 milliliters (c.c.)
*Ethyl abietate	1.5 milliliters (c.c.)

* ½ above of castor oil is a substitute.

Using the latter solution as solvent, add the nitrated cotton until the solution is of the consistency of syrup. Dissolving the cotton takes about two hours. If the mixture is too thick, a little more of the above solvent, which should be kept on hand, is added.

The above solution should not blush when applied to any surface. It should dry quickly into a tough film which is stable over a long period owing to the plasticizer, ethyl abietate.

The above is useful for cementing cross hairs, coating labels, sealing rubber to tubing, etc.

In case a more flexible film is desired the amount of the plasticizer may be doubled. In case of blushing increase amyl acetate.

Litharge Cement for Joining Metal to Glass

In the preparation of tanks with glass sides or bottom, it is desired to make these water tight by cementing the glass to the iron frame or to repair the leaks that may occur.

Litharge (PbO)	260 grams
Glycerin solution (glycerin 2 parts, water 1 part)	100 milliliters (c.c.)

Place the litharge in a mortar, add the diluted glycerin slowly while grinding. Mix thoroughly by grinding a short time. Heat will be evolved and the mixture will begin to set. While still soft, pour it into place and by means of a spatula work it into position as in the case of putty. Allow to stand for a day when it will be thoroughly hard.

If desired, it may be covered with a layer of white lead or aluminum paint.

Mucilage or Paste

Gum arabic (gum acacia)	1 part
Rice starch	1 part
Sugar	4 parts
Water	10 parts

Warm the gum arabic with some of the water until it has a jelly-like consistency. Mix the sugar and starch with enough water to make a smooth paste. Combine these two mixtures, and boil until the starch is clear.

Shellac Cement

De Khotinsky Type

(Benzene Resistant)

Note: Most recipes for de Khotinsky cement call for pine tar, to the amount of 40 to 50 %, as the material with which shellac is plasticized for the application in question. Recent investigation indicates that pine tar is inferior to the creosote plasticizer recommended below.

Prepare the plasticizer by mixing one volume of terpineol with three volumes of beechwood creosote (alkali-soluble). Coal-tar creosote, not completely alkali-soluble, will not do.

Heat from 12 to 25 grams of the plasticizer to about 130° C. With constant stirring add 85 grams of shellac as fast as it dissolves smoothly. When the mixture is homogeneous, allow to cool until it will barely flow from the vessel, and pour into molds which have been lightly but completely covered with petrolatum. The use of only 12 grams of plasticizer gives a very hard cement; 25 grams gives a very soft product.

Shellac-Wax Cement

(Benzene Soluble)

Rosin	35 grams
Shellac	20 grams
Beeswax	20 grams
Talc, fibrous (asbestine pulp)	0 to 30 grams

Melt the rosin in a large (6 or 8 in.) hemispherical iron pan, add the shellac and beeswax with stirring. Heat strongly with a large Bunsen flame so that the temperature reaches 360° C. in six minutes; then extinguish the burner. When the temperature has reached about 275° C., add the talc, if any is to be used. Finally when the mixture is so viscous that it will barely pour from the pan, pour into metal molds which have previously been very thoroughly scoured with washing powder and thickly coated with aqueous dextrine paste which is still wet. The talc gives a more viscous cement at temperatures just above the melting point.

Transparent Sealing Resin

A transparent resin which adheres well to glass, quartz and metals may be made by heating together equimolal quantities of phthalic anhydride and ethylene glycol for 24 hours at 200° C. The resin softens at 95°–110° C. It is unaffected by water but slowly dissolved by organic solvents and is particularly useful for high-vacuum seals.

Vacuum Wax

Wax for coating joints which may be used for ordinary vacuum distillations etc. where the temperature does not get too high:

Melt together equal parts (by weight) of beeswax and rosin. The product is pliable and easily removed from apparatus by simply using hot water.

CLEANING COMPOUNDS AND METHODS

Alcoholic Sodium Hydroxide Solution for Cleaning

Dissolve 120 grams sodium hydroxide in 120 c.c. water. Dilute to 1 liter with 95 % alcohol.

Burette Cleaning Assembly

A burette cleaning assembly may consist of a 300 c.c. beaker of cleaning solution mounted on a ring stand having a 7 × 9″ base. Higher on the stand is a clamp for engaging the burette to be cleaned and still higher a mounting of $\frac{3}{16}$″ rubber tubing connected with an aspirator. The cleaning solution is heated, the burette placed with its top dipping into the cleaning solution while the aspirator tubing is slipped on the delivery end of the burette. When hot cleaning liquid has been aspirated to near the glass stopcock or pinch-cock, the cock is closed and the aspirator tubing slipped off, leaving the cleaning solution in the burette. After a minute or so, the cock is opened and the cleaning solution is allowed to run out of the burette, which will leave a uniform film if the burette is clean. The burette is transferred to a sink and after cooling is rinsed with tap and distilled water. By this means 50 burettes per hour may be made ready for use.

Brown Stains on Burettes

Brown stains left on the inside of burettes used for $KMnO_4$ solutions may be removed by filling the burette with $FeSO_4$ solution after which the liquid is removed and completely washed out. A convenient, ready for use, solution of $FeSO_4$ may be made by placing small nails in a dilute H_2SO_4 solution, keeping the flask closed except for a hydrogen vent, thus preventing oxidation of the iron.

Cleaning Engler Flasks

To thoroughly remove all of the carbonaceous deposit baked in the bottom of an Engler flask from gasoline distillation, place 2 or 3 grams of commercial Na_2SO_4 in the flask to be cleaned; apply heat directly to the flask from a Bunsen burner. Heat until all the carbon residue has been loosened. Cool, rinse and drain.

Cleaning Fermentation Tubes and Other Glassware

Fermentation tubes (used in water testing) and other glassware difficult to clean in the ordinary way, may be cleaned as follows:

Moisten the inside of the tube with ethyl alcohol. Pour off the excess alcohol, leaving not to exceed two c.c. of the liquid in the tube. Add ten c.c. of concentrated nitric acid and let it stand. Soon a vigorous reaction takes place with the elimination of large quantities of nitrogen dioxide. When the reaction stops, wash with water. As some nitric acid may be blown out of the tube, it should be placed in a sink (preferably in a hood) until the reaction ceases. Do not close the tube.

Cleaning Fluid

An excellent solution for cleaning grease stains from cloth or leather consists of the following:

CCl_4	80 %
Ligroin	16 %
Amyl alcohol (ter.)	4 %

Cleaning Mercury

Mercury may be cleaned sufficiently for many laboratory purposes without distilling. Allow the mercury to fall in a fine spray into a quantity of dilute nitric acid, 25 parts of acid to 75 parts of distilled water. After being passed through the acid one or more times it should be passed through distilled water and dried. Most of the water may be removed with a clean filter, and the mercury heated in a porcelain dish to about 110° C. To produce the spray the stem of a glass funnel may be drawn down so as to leave only a small opening for the escape of mercury or a glass tube with a capillary point attached to a funnel with a tightly fitting rubber tube.

A three- to four-foot length of one-inch glass tube closed at one end and supported in a vertical position may be used to contain the acid solution. If a small glass tube be fused into the lower closed end of the large tube, and bent so as to stand up for a distance a little greater than 1/13.6 the column of acid solution in the large tube, a U-tube is formed in which a short column of mercury supports the long column of acid solution.

The end of the small tube should be bent over at the top so as to facilitate the delivery of the mercury and a short piece of clean rubber tubing with a pinch-cock put on at the start; as soon as mercury enough has collected in the bottom of the tube the pinch-cock may be opened. The mercury will rise nearly or quite to the top of the small tube, and as the quantity increases will be delivered from the small tube as fast as it falls in the spray.

The reversed end of the small tube should be short to avoid forming a siphon, which would completely empty the apparatus.

An efficient procedure, especially if the mercury is greasy, consists in spraying the mercury by means of the above apparatus, first, through a dilute solution (10 %) of potassium hydroxide, then through dilute nitric acid (10–15 %) and finally through distilled water.

Cleaning Optical Surfaces for Silvering

(From Miller's Laboratory Physics, Ginn & Co., publishers, by permission.)

Probably the most important part of the silvering process is the proper cleaning of the surface to be silvered.

The surface is thoroughly cleaned of grease or other organic matter by the usual methods, using alcohol or chromic acid. Then it should be carefully cleansed with strong nitric acid, the whole surface being firmly rubbed with clean cotton tied to a rod of wood or glass. Care should be taken not to injure the surface. Rinse with water, and then wash the surface thoroughly with a strong solution of caustic potash, rubbing with a cotton brush as before. Finally, rinse with distilled water, and keep the surface wet until it is placed in the silvering solution. If the distilled water wets the whole surface uniformly the cleaning may be sufficient; if it does not wet uniformly, the operations must be repeated. The fingers should not touch the edges of the glass during the latter cleaning operations, as a layer of organic matter is apt to spread over the surface and render the silvering uneven.

Dr. Brashear recommends that the surface, after the washings described above, be rubbed with prepared chalk on a cotton wad until it is thoroughly dry and clean. It may then be put into the silvering solution at one's convenience.

Cleaning Solution for Glass

35 c.c. saturated sodium dichromate (technical)
1 liter conc. sulfuric acid poured into the dichromate solution

Avoid contact with the flesh or clothing.

Cleaning Solution

Trisodium phosphate	2 oz.
Sodium oleate	1 oz.
Distilled water	1 pint

Soak apparatus in the warm solution 10–15 minutes, then brush with a stiff brush.

Iodine Stains

Iodine stains can readily be removed from clothing by washing the stain with a 10 % solution of sodium thiosulfate ("hypo") in water.

Paint Brush Cleaner

(1)	Kerosene	2 pints
	Oleic acid	1 pint
(2)	Aqueous ammonia (conc.)	¼ pint
	Denatured alcohol	¼ pint

Stir (2) into (1) until uniform. To clean brushes, place in the mixture over night. Wash thoroughly with warm water.

Removal of Carbonaceous Matter

A 10–15 % solution of NaOH or KOH removes carbon etc. quickly. Rinse well with acid and H_2O.

Removing Carbon Deposits from Flasks

First rinse flask with acetone or carbon disulfide to remove traces of oil or tar. Add a few grams of magnesium nitrate. Heat gradually over a free Bunsen flame till water is all expelled and the magnesium nitrate melts. Rotate the flask to distribute the melt and continue the heating till the brown fumes of nitric oxide cease to evolve. Finally cool and dissolve the residual magnesium oxide in dilute acid by boiling.

Large deposits of carbon or tar will require a repetition of the above procedure.

Removing Carbon Residue from Glassware

Tri-sodium phosphate (Na_3PO_4)	2 tablespoonfuls
Sodium oleate	1 tablespoonful
Soft water	1 quart

Allow to stand in the solution for several minutes, brush off the incrustation and rinse with water.

COLORED LIQUIDS

For rendering columns of water easily visible, add a few drops of one per cent alcoholic solution of fluorescein to a liter of water. The dilute solution of fluorescein is bright green by reason of its fluorescence, although colorless by transmitted light.

A small quantity of an aqueous (1 %) solution of uranine (the sodium salt of fluorescein) may be used in place of the alcoholic solution mentioned above.

If liquids showing color by transmission are desired, dilute aqueous solutions may be made with any of the following dyes:

Dye	Color
Erythrosine	Pink
Eosine	Pink (green fluorescence)
Rhodamine B	Pink (red fluorescence)
Ponceau 2R	Scarlet
Naphthol green	Green
Methylene green	Bluish green
Methylene blue	Blue
Methyl violet	Purple

CROSS HAIRS

The spider lines which serve as an index in reading telescopes may be quickly replaced in an emergency by single silk fibers (from ordinary sewing silk) attached by soft wax. Single fibers may easily be removed from an untwisted strand.

Spider web should be used in permanent work. The fibers of the egg nest of certain species are employed and may be obtained of most dealers in scientific apparatus. In mounting them the following suggestions may be useful: The cross hair diaphragm of the telescope should be removed and clamped in a horizontal position. A bow of brass wire, about No. 28, should be employed to stretch the fiber. A background of black velvet makes the fibers more easily visible. With soft wax or other convenient adhesive ready on both tips of the bow, a fiber of the required length is to be disentangled with tweezers and wrapped several times about the ends of the bow under tension sufficient to straighten the fiber. The fiber, now conveniently handled by the wire bow, should be cautiously lowered onto the diaphragm in the proper position, the wire left hanging.

A small drop of shellac varnish applied at each side will hold the fiber in position as soon as it is thoroughly dry, after which the ends of the fiber should be cut away.

DIALYZERS

As a substitute for parchment and similar natural membranes, it has been found that those made from cellulose trinitrate are superior. "Parlodion" (DuPont)* may be used, dissolving one part of the nitrate in 2 each of ethanol and ethyl ether. The water adhering to the Parlodion should first be removed (the shreds are preserved by covering with water), otherwise a clear solution will not be obtained. Cut the round end off a ¾″ or 1″ test tube, and dip the flared end of the tube into the alcohol-ether solution of "Parlodion." Upon removing the tube from the solution a film will be found across the tube and after evaporation of the solvents the film will be found to be of sufficient strength to meet the purposes of a dialyzer. The liquid to be dialyzed is poured into the tube and contents are then set in a beaker of water. In a short time the working of the semi-permeable membrane will be shown by the rise of the level of the liquid inside the tube.

EXPANSION OF GLASSES, TEST FOR EQUALITY OF

In order to compare the coefficients of expansion of two pieces of glass, prior to sealing them together, melt the drawn out ends of each piece to beads; press these molten beads together with tweezers and draw into a thread. If the glasses can be sealed together, the thread will be straight; otherwise, it will curve because of the different coefficients of expansion.

---

* Trade name.

FLUORESCENT SCREENS

For observations of the ultraviolet spectrum, moisten a small quantity of anthracene with water and brush a thin layer over a ground-glass surface. On drying most of the anthracene will adhere to the glass. The prepared surface should be placed so as to receive the radiation directly, glass being comparatively opaque to the shorter wave lengths.

GLASS GRINDING FLUID

Turpentine	45	c.c.
Ether (ethyl oxide)	22.5	c.c.
Camphor gum	31	g

To be used with powdered emery for grinding glass.

For smoothing edges a sheet of emery cloth moistened with the above solution may be used.

Plane surfaces should be ground on thick plate glass.

For grinding glass stoppers use coarse emery, turn in one direction, finish with fine emery.

GLASS GRINDING MEDIUM

Glycerin may be used instead of a camphor-turpentine mixture for a medium in which to suspend emery powder for grinding glass. Glycerin has body enough and is sufficiently viscous to carry the emery well, and besides this it is water-soluble, thus making it very easy to wash away the excess grinding agent when the job is done or when it is desirable to make a close inspection of the work done.

HEATING BATH

A bath fluid at temperatures above 150° C. and which does not appreciably affect glass is prepared by fusing 10 parts of potassium nitrate with 8.5 parts of sodium nitrite.

HEATING BATHS

For uniform heating of reactions the following materials have proven satisfactory:

For temperatures up to 100° C.	Steam
For temperatures from 100° – 250° C.	Crisco or Nujol
For temperatures from 200° – 300° C.	*o*-tolyl phosphate
For temperatures above 250° C.	Wood's metal.

HECTOGRAPH FILLER

Ingredients: ½ oz. of ground (dried) glue; 2 oz. of dried gelatine; 18 fluid oz. glycerin. These amounts should provide sufficient filler for a pan 12″ × 9″ × ½″.

Mix the glue with water and digest it on a water bath (a double boiler may be used) until it has the consistency of cream and is thoroughly melted. Soak the gelatine in cold water till soft free it from as much water as is possible by pressure in a cheesecloth and then melt it on a water bath or in a double boiler. Pour the three liquids together, and after they are thoroughly mixed, pour them into the pan. If any bubbles appear on the surface of the filler, scrape them off with the edge of a piece of cardboard while the filler is hot. Do not use the filler until at least six hours after it has been poured into the pan. The materials gel slowly. Keep the pan level and covered until its contents is no longer fluid.

HECTOGRAPH INK

Violet

Aniline violet	1 oz.
Hot water	7 oz. fl.

On cooling, add:

Alcohol	1 oz.
Glycerin	¼ oz.
Carbolic acid (phenol)	a few drops

Black

Nigrosine	1 part
Water	14 parts
Glycerin	4 parts

HYDROGEN SULFIDE

Pure hydrogen sulfide may be generated by allowing distilled water to drop on aluminum sulfide.

HYDROGEN SULFIDE SUPPLY

Mix and heat slightly 3 parts by weight of sulfur with 1 part by weight of paraffin. Then mix with sufficient shredded asbestos to make a porous mass. Partly fill an 8″ Pyrex test tube, connect with delivery tube and safety bottle. Heat. Furnishes good supply of H_2S. No leakage into the room as generation of H_2S ceases as soon as heat is removed. Mixture keeps. Test tube may be heated over again until reactants are used up.

INK FOR GLASS MARKING

Barium sulfate	15 parts by weight
Ammonium bifluoride	15 parts by weight
Ammonium sulfate	10 parts by weight
Oxalic acid	8 parts by weight
Glycerin	40 parts by weight
Water	12 parts by weight

If too thick, add more water. If the action is too slow, up to 5 % of sodium fluoride may be added. Use in a hood or well ventilated room.

LABEL PROTECTION

Collodion for Labels on Bottles

Dissolve 3–4 grams pyroxylin in 100 c.c. 1:3 mixture of alcohol and ether (25 c.c. absolute alcohol, 75 c.c. dry ether).

First soak the pyroxylin in the alcohol, then add the ether.

Labels for Bottles

Labels should be written in India Ink. They can be made waterproof and durable by coating with a saturated solution of paraffin in benzene.

Lacquer for Protecting Labels

An excellent lacquer for protecting labels may be made by dissolving 20 grams of vinyl acetate polymer (Vinylite A) in 100 c.c. of a mixture of 3 parts of toluene and 1 part of 95 % alcohol. This lacquer forms a colorless, transparent film which resists most reagents very well.

Protecting Varnish for Labels

Typed labels may be protected by several coats of a varnish made by dissolving ordinary tooth brush handles in acetone. The quantity of solvent should be adjusted to give a convenient viscosity. The varnish is water and acid resistant.

LOW MELTING ALLOY

The following alloy, Wood's metal, melts at about 65° C.:

Bismuth	50	parts by weight
Lead	25	parts by weight
Tin	12.5	parts by weight
Cadmium	12.5	parts by weight

LUBRICANT, DRY

Melt a quantity of paraffin and add as much fine flake or powdered graphite as is readily moistened by the melted wax. Cool and cut while soft into convenient sticks.

This lubricant when rubbed on the surfaces involved, adheres and greatly reduces friction. It is particularly useful when one or both of the surfaces are of wood or other non-metallic substance.

MILDEW PREVENTION ON LEATHER BOOK BINDINGS

Make a 2 % to 5 % solution—not more than 5 %—of copper sulfate. Immerse a soft towel or cloth in this solution. Remove the cloth and thoroughly wring out. Then hang out to dry. When thoroughly dried, it can be used to rub leather bound books. One treatment of the cloth will easily take care of scores or a hundred volumes, and the leather will not be marked by the chemical.

MIRRORS FOR SPECTROMETER ADJUSTMENT

A small square of thick plate glass with edges ground smooth and silvered on one surface affords a means of accurate adjustment.

To avoid the necessity of frequently resilvering, which arises where the mirrors are in constant use, the following course is suggested:

From selected German plate mirror 2 to 3 mm thick, cut two pieces of the same size, say 4 × 5 cm. Remove the protective layer of varnish or paint from both pieces by soaking in alcohol and rubbing with cotton, being careful not to injure the silver surface. From one piece remove every trace of varnish by repeated rinsing, dry and polish the silver surface thus exposed by stroking lightly with a chamois rouge pad. From the other piece remove the silver by nitric acid, wash thoroughly in distilled water and dry. Cement the clear piece on the silver face of the other with Canada balsam. This is accomplished by placing two or three drops of Canada balsam in xylol (obtained in collapsible tubes) on the center of the silver face, and evenly lowering upon it the clear glass. The balsam should spread rapidly to the edges of the plates. Minute bubbles of air in the balsam film are harmless; if large bubbles are present the plates should be slipped apart, cleaned with alcohol and the process repeated.

The balsam will be sufficiently hard in a few days to allow the excess to be scraped from the edges and the plates bound together with lantern slide binding strip. Gentle heat may be used to harden the balsam more rapidly.

PHENOL (CARBOLIC ACID) BURNS

To c. p. glycerin add bromine until slightly colored or saturated. Keep in glass stoppered bottle and apply quickly to phenol burns. The bromide reacts instantly with the phenol to form bromophenol.

POLARITY TEST PAPER

Dissolve one gram of phenolphthalein in a small quantity of alcohol. Add the solution of phenolphthalein to 100 c.c. of a 10 per cent solution of potassium chloride in distilled water. Filter paper should be soaked in the solution and dried. A strip of paper moistened with water and placed in contact with the two terminals will show a bright red stain at the negative terminal.

PURIFICATION OF ALCOHOL

To remove aldehydes from alcohol intended for use in the preparation of alcoholic solutions of sodium or potassium hydroxide, add to one liter of alcohol 5 to 10 grams of aluminum or zinc and 8 to 10 grams of potassium hydroxide; boil under reflux for 20 minutes, and distil. Best results are obtained if an all-glass apparatus is used. Alcoholic solutions, prepared with alcohol so treated, will not discolor if the purification of the alcohol has been carefully carried out.

RESISTANT PAINTS AND VARNISHES

Acid Proof Wood Stain

Solution No. 1	Solution No. 2
125 grams of copper sulfate	150 grams of good fresh anilin oil
125 grams of potassium chlorate	180 grams of concentrated hydrochloric acid
1000 grams of water	1000 grams of water

Wood must be free from paint, varnish, grease or chemicals. Apply two coats of solution No. 1 boiling hot with a paint brush, allowing each coat to dry thoroughly before the next coat is applied. Then apply two coats of solution No. 2 in the same way. When the wood is completely dried wash off excess chemicals with hot soapsuds. Finish with raw linseed oil. Polish comes from rubbing the oil down well with a cloth or sponge. Whenever the tables get dingy again go over them with a coat of linseed oil and rub smooth.

Resistant Coal Tar Varnish

A resistant varnish is made from coal tar pitch as follows:

Coal tar pitch	65 parts by weight
Phenol	5 parts by weight
Benzene	30 parts by weight

Resistant Paint

The following paint when used on galvanized iron has been found to hold up well, without cracking or peeling in a three year's test. It can also be used on black iron, tin, copper, or stone such as is used for laboratory desk tops. It withstands dilute acids.

Formula: Stir in 10 parts by weight of benzol into 30 parts by weight of ordinary thin coal tar. Then add with vigorous stirring 10 parts by weight of Silica Black (a new product patented under U. S. No. 1,940,352).

SCALE POLISH

To brighten up refractometer and polarimeter scales without injury to the metal rub with bone black or clarifying charcoal. A dry cloth with a little of the bone black is rubbed on the scale until a bright polish is produced. The divisions then stand out clearly and are easily read. The great advantage is that the fine lines are not worn away and no corrosive material is left to cause discolorations.

SILVERING GLASS

Brashear's Process

(From Miller's Laboratory Physics, Ginn & Co., publishers, by permission.)

Two solutions are required, one, the reducing solution, should be prepared at least a week before it is used, and it may be made in large quantity and kept in stock with advantage; the other solution is to be prepared when used.

Reducing Solution

Distilled water	700 c.cm.
Pure sugar (loaf, granulated or rock candy)	80 g.

When dissolved add

Alcohol	175 c.cm.
Strong nitric acid (sp. gr. 1.42)	3 c.cm.
Add water to make	1000 c.cm.

For silvering, the mirror may rest face up on the bottom of a suitable dish; it may stand on edge, or be supported in any manner, face downward, dipping into the upper part of the solution. In the latter case, the mirror may be fastened with wax to a stick laid across the dish, or it may be supported on glass feet or on paraffined wood wedges. Dr. Brashear recommends that the mirror, if round, form the botton of the silvering dish, which is completed by wrapping a strip of paraffined paper around the edge of the mirror, this being held in place by rubber bands or fastened with several wrappings of cord.

Having selected a dish and support for the mirror, measure with water the quantity of solution that will be required to make a layer a centimeter or two thick over the surface to be silvered. For each 150 c.cm. of final solution, 1 g. of silver nitrate and 0.5 g. of caustic potash (purified by alcohol) will be required. Dissolve the silver and potash separately, using quantities of water of the proportion of 10 c.cm. to 1 g. of the solid. Ordinary graduates or flasks are the most convenient form of vessel in which to mix the solutions. Into the silver nitrate solution pour a few drops of dilute aqua ammonia. The solution will turn to a dark brown color; add ammonia little by little till the precipitate is nearly but not quite redissolved. Now add the potash solution, when a precipitate will again be formed. This is to be nearly, but not entirely, redissolved by the addition of more ammonia, a few drops being sufficient this time. After the ammonia has been added shake or stir the solution well and wait a minute or two to be certain that it does not entirely clear. If by chance too much ammonia has been used, a little silver nitrate is to be dissolved and added, a few drops at a time, till a permanent precipitate is formed. This excess of silver must be present, the solution showing a decided brown tint. The solution may be filtered, though usually this is not necessary.

A quantity of reducing solution equal to about one fourth part of the solution just prepared is measured out. The mirror, having been properly cleaned and rinsed with distilled water, is placed in position. The reducing solution is poured into the silver and potash solution, and mixed by a quick shaking of the graduate or stirring with a glass rod; the whole is then poured into the dish. If the mirror is immersed face down, care is necessary to remove air bubbles; the mirror may well be immersed after the solution is in, being dipped in at one side first. If the mirror is at the bottom of the dish, after cleaning it is covered with a thin layer of water, and the prepared solutions are poured into the dish without further trouble. In the latter case the dish must be rocked during the time of deposition.

The solution soon turns to a black color, which in a few minutes will turn to a brown; and when it becomes a light gray and the precipitate is flocculent, which may be in ten or fifteen minutes, the operation is at an end. If the mirror is allowed to remain in the solution too long, the surface will have a bleached appearance, which polishing will hardly remove. Remove the mirror, rinse with water, and carefully wipe off the sediment with a tuft of absorbent cotton. It is then set on edge to dry; a rinsing with alcohol will facilitate the drying, or all water may be safely taken up by pressing clean blotting paper over the surface.

When dry, the surface may be polished, if necessary, with a small pad of chamois leather stuffed with cotton, on which is spread a little rouge. Small, circular strokes of the pad, with light pressure, will soon bring out the deep luster of the silver.

A uniform temperature of the bath and the glass, of about 20° is essential to success.

Since fulminating silver is liable to be produced by the action of ammonia on silver oxide, especially in a warm room, all solutions should be thrown away as soon as the silvering operation is completed. The used solutions may be poured into a large jar, in which is thrown some common salt; this causes the silver to be precipitated as the chloride, and about 90 per cent of the original silver may be recovered.

ROCHELLE SALTS PROCESS

(From Miller's Laboratory Physics, Ginn & Co., publishers, by permission.)

For depositing the uniform thin film of silver required on the half-silvered glass of the interferometer, the following method is more suitable than the one described above, as the silver is deposited more slowly. If a thick film is desired, two or more successive deposits may be made, each of which may require an hour's time.

Dissolve 5 g. of silver nitrate in 300 c.cm. of distilled water, and add dilute aqua ammonia until the precipitate formed is nearly, *but not entirely*, redissolved in the manner explained in the preceding method. Filter the solution and add water to make 500 c.cm.

Dissolve one g. of silver nitrate in a small quantity of water and pour into about half a liter of boiling water; dissolve 0.83 g. of Rochelle salts in a small quantity of water, and add to the boiling solution. Continue the boiling for half an hour, till the gray precipitate collects as a powder in the bottom of the flask. Filter hot, and add water to make 500 c.cm.

These solutions may be kept in the dark for a month or two.

For silvering, equal volumes of the two solutions are mixed, and the glass is supported in the mixture in whatever fashion is convenient. Various methods are mentioned in the preceding article. The thickest possible deposit may require an hour's time. A second deposit may be made upon the first if necessary to secure the desired thickness. The drying and polishing may be carried out as described above.

A half-silvered film will be produced in about a minute; only experience can determine when the proper thickness has been secured. The glass appears as though it were very lightly smoked. A film that reflects a little more than half the light incident at 45° is desirable for interferometer use. A simple method of testing is to look at two similar gas flames, one seen through the film and the other seen reflected by it. It is well to silver at once all four surfaces of the two plane-parallel plates of the interferometer and to select for use that film which is of the proper and most uniform thickness.

SOAP SOLUTION FOR SOAP FILM EXPERIMENTS

Pure castile or palm-oil soap	1 oz.
Distilled water	8 oz.
Pure glycerin	4 oz.

Cut the soap in thin shavings and dissolve in the water. When the solution is complete, add the glycerin and mix very thoroughly. On standing the liquid becomes clear at the bottom. The clear portion may conveniently be removed by a siphon and preserved indefinitely.

SODIUM FLAME

An intense sodium flame is readily obtained by placing a small lump of rock salt in the center of the screen on a lighted Meker burner.

SODIUM LIGHT

Paper is to be soaked in a saturated solution of common salt, borax or other salt of sodium, and dried. When wrapped around a Bunsen burner, secured by a twist of wire and pushed up into the edge of the flame, a sodium flame of considerable intensity is obtained. As the ash of the paper breaks away it must be occasionally raised. Lithium chloride may be used in place of or with sodium salt to give the lithium line for spectrometric measurement. Sheet asbestos (thin) may replace the paper if desired. Since the asbestos is not consumed it is necessary to moisten the mantle with salt solution at intervals.

SOLDERING PYREX GLASS TO METAL

Dip the Pyrex glass tube to be soldered into a solution of chlorplatinic acid (or platinic chloride may be substituted) made by preparing a mixture consisting of 0.2 gram of the acid with 5 c.c. each of alcohol and ethyl ether to which 4 or 5 drops of turpentine have been added. After dipping the tube, carefully burn all the adhering liquid away leaving a film of platinum metal. That film will serve to hold the solder to the Pyrex glass and in doing so makes a very satisfactory gas-tight joint for a metal to glass connection.

SOLDERS

Composition by weight						Approximate temperature of fusion	Metals for which it is used	Flux commonly used
Lead	Tin	Copper	Zinc	Silver	Gold			
1	1	....	....	....	..	220° C.	Lead	Tallow
3	5	....	....	....	..	180	Zinc	Zinc chloride 25% HCl

		4	....	6	10	....	Gold	

STOPCOCK LUBRICANTS

Seal for Ground Glass Joints

Glycerin makes a very satisfactory seal for ground glass joints to prevent leakage of petroleum ether, ethyl ether or any other fluid in which glycerin is insoluble. Glycerin on the ground glass surface prevents sticking and so allows for the easy dismantling of the apparatus.

Stopcock Grease

Shepherd and Ledig (J. Ind. Eng. Chem. 19, 1059, 1927) prepare stopcock grease from the following ingredients by mixing with continuous stirring for 190 hours at 155° C., then placing the mixture in small 2 oz. containers, immediately chilling the contents on ice and allowing to age for 10 days before use. For high vacuum: 31 parts crepe rubber, 24 parts white "Vaseline" petroleum jelly, 5 parts paraffin (m. p. 36° C.); for general lubricant: 6 parts crepe rubber, 7 parts "Vaseline" petroleum jelly, 1 part paraffin; for light lubricant: 10 parts smoked sheet or pale crepe rubber, 18 parts "Vaseline" petroleum jelly and 1 part paraffin (m. p. 30° C.).

Stopcock Grease

Black rubber (red or pure gum)	1 part
Paraffin	2 parts
"Vaseline" petroleum jelly	4 parts

Melt the paraffin and "Vaseline" petroleum jelly together, add the rubber slowly and in small pieces taking care not to burn the rubber. A larger quantity of "Vaseline" petroleum jelly may be desirable.

Stopcock Lubricant

Petrolatum (500 grams) and raw crepe rubber (50 grams) are stirred together and kept in an oven at 125°–150° C. for several days, or until the mixture is homogeneous.

Stopcock Lubricant

Standard Viscous Oil No. 32 (Standard Oil Co. of California)	200 grams
Aluminum stearate	50 grams

Dissolve the stearate in the oil, heated to about 150° C., and cool. This makes an extremely sticky, ropy, tough adhesive for ground glass surfaces.

Stopcock Lubricant

In the laboratory it is often desirable to have a stopcock lubricant that will not dissolve away with the ordinary fat solvents such as the hydrocarbons or chlorinated hydrocarbons. In some set-ups the ordinary stopcock greases are quite useless, and syrupy phosphoric acid is very unsatisfactory.

A paste of Bentonite (colloidal clay) and glycerin may be used for such a purpose. One can adjust the viscosity of the paste to suit his needs. Such a lubricant is entirely unaffected by the non-aqueous solvents, and even in the presence of water holds remarkably long, probably due to the fact that the Bentonite makes a jelly with either glycerin or water. In addition it has the very decided advantage of permitting a stopcock lubricant to be used at temperatures up to or even well above 100° C. The viscosity does not diminish very much with rise in temperature.

UNIVERSAL WAX

(1) A soft wax useful in the laboratory may be made by melting together paraffin, "Vaseline" petroleum jelly and paraffin oil in various proportions according to the pliability desired.

(2) Another authority recommends equal quantities of beeswax and turpentine (by weight). It is customary to color the wax by adding finely-powdered Venetian red.

(3) Melt together 1 part of Venice turpentine and 5 parts of beeswax. Color with vermilion.

PHOTOGRAPHIC FORMULAS

Compiled by Haywood Parker, Jr.

In the processing of photographic materials, the best results will generally be obtained by following the manufacturer's recommendations. In certain special applications, however, as in technical or scientific work, special characteristics may be desired which indicate the use of other than the recommended solutions.

In selecting the formulas included here, the aim has been to provide a group of reliable, standard formulas covering all the needs normally encountered in the various applications of black-and-white photography.

Pure water, preferably distilled, should be used in all solutions. Desiccated or anhydrous sodium sulfite and the monohydrate of sodium carbonate are specified in most of the formulas. If other crystalline forms are used, the quantities should be adjusted according to the relative molecular weights.

Quantities are given in both metric and avoirdupois—U. S. liquid units. The values are not interchangeable between the different columns since the volumes of solution are not exactly the same. According to usage in the photographic field, volumes of liquid in the metric formulas are given in cubic centimeters (c.c.), rather than in milliliters (ml.). The milliliter is 1.000027 cubic centimeter, so that the units are, of course, interchangeable for photographic uses.

The following abbreviations are employed:

anh.	anhydrous
c.c.	cubic centimeter
dr.	dram
gm.	gram
gal.	gallon
gr.	grain
l.	liter
min.	minim
ml.	mililiter (equivalent to cubic centimeter, cm^3 or c.c.)
oz. (av.)	ounce (avoirdupois)
oz. fl.	fluid ounce
qt.	quart

The following conversion factors may be used:

1 oz. (av.) = 437.5 gr.
1 oz. (fl.) = 8 dr.
1 gal. (U. S.) = 3.7853 liters

DEVELOPERS

When a time of development is suggested, it is intended to serve as a guide only. Individual requirements as to density and contrast vary. Greater or less contrast may be obtained by developing for a longer or a shorter time respectively. The times given for tray development are for continuous agitation, those for tank for intermittent agitation.

GENERAL PURPOSE NEGATIVE DEVELOPERS

(See also the section on Universal Developers.)

Elon-Hydroquinone (Kodak DK-50)

Developer for professional films and plates.

Stock Solution

Water, about 125° F. (52° C.)	64 oz.	1¾ gal.	500 c.c.
Elon	145 gr.	1 oz. 75 gr.	2.5 gm.
Sodium sulfite, desiccated	4 oz.	14 oz. 75 gr.	30 gm.
Hydroquinone	145 gr.	1 oz.	2.5 gm.
Kodalk (sodium metaborate ($4H_2O$))	1 oz. 145 gr. (583 gr.)	4¾ oz.	10 gm.
Potassium bromide	30 gr.	100 gr.	.5 gm.
Water to make	1 gal.	3½ gal.	1000 c.c.

Dissolve chemicals in the order given.

Tray Development.—Use without dilution and develop about five minutes at 68° F. (20° C.).

Tank Development.—Use without dilution and develop about six minutes at 68° F. (20° C.). If a somewhat longer time is preferred, dilute with an equal volume of water and develop about nine minutes at 68° F. (20° C.).

Replenisher (Kodak DK-50R)

Water, about 125° F. (52° C.)	96 oz.	750 c.c.
Elon	290 gr.	5 gm.
Sodium sulfite, desiccated	4 oz.	30 gm.
Hydroquinone	1 oz. 145 gr. (583 gr.)	10 gm.
Kodalk (sodium metaborate $4H_2O$)	5¼ oz.	40 gm.
Water to make	1 gal.	1000 c.c.

Dissolve chemicals in the order given.

Instructions for DK-50R Replenisher

For Large Tanks (one gallon or more).—The replenisher should be added at a rate which will maintain constant development activity. Ordinarily this will be achieved by adding 6 gallons per 1000 rolls processed (approximately 80,000 square inches) or ¾ ounce per roll. In many cases this volume of replenisher will coincide with the quantity of developer lost through use. In other cases it may be necessary also to remove some exhausted developer or to add fresh developer in addition to the replenisher to maintain constant level in the tank.

The replenisher should be added and stirred in thoroughly after every batch of films or after not more than 4 rolls (320 square inches) have been processed per gallon of developer.

For Small Tanks (less than one gallon).—Ordinarily, constant developer activity will be maintained by adding 1 ounce of replenisher for each 80 square inches of film. This is equivalent to one 8 by 10 inch or four 4 by 5 inch sheet films, one 620 roll film, or one 36-exposure roll of 35 mm film. After processing 1 roll of film, pour 1 ounce of replenisher solution into the empty developer storage bottle. Then pour enough used developer into the bottle to fill it to the original volume, discarding any excess. If short of the original volume, add unused developer solution or replenisher diluted 2 parts with 1 part of water to make up for the loss. Repeat for each roll developed.

Metol-Hydroquinone Developer (Ansco 47)

This is a long-life, clean-working formula which will give excellent results as a standard film developer for either tray or tank development.

Kodak Developer D-61a, diluted one for one, is closely similar to this developer used full strength.

Hot water (125° F. or 52° C.)	3 qt.	2½ gal.	750 c.c.
Metol	88 gr.	½ oz. 90 gr.	1.5 gm.
Sodium sulfite, anh	6 oz.	1 lb. 5 oz. (21 oz.)	45 gm.
Sodium bisulfite	60 gr.	½ oz.	1 gm.
Hydroquinone	¼ oz. 65 gr.	1¼ oz. 65 gr. (612 gr.)	3 gm.
Sodium carbonate, monohydrated	¾ oz. 25 gr.	2¾ oz.	6 gm.
Potassium bromide	47 gr.	¼ oz. 55 gr.	.8 gm.
Water to make	1 gal.	3½ gal.	1000 c.c.

TANK DEVELOPMENT: Used without dilution. Normal development time 6 to 8 minutes at 68° F. (20° C.) with occasional agitation. For longer developing times, dilute one part developing solution with one part water and develop 12 to 16 minutes at 68° F. (20° C.).

TRAY DEVELOPMENT: Normal development time 5 to 7 minutes at 68° F. (20° C.).

Replenisher (Ansco 47A)

Add ¾ ounce of replenisher to Ansco 47 for each roll of 120 film (or equivalent) developed.

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol	45 gr.	¼ oz. 65 gr.	3 gm.
Sodium sulfite, anh	1½ oz.	6 oz.	45 gm.
Sodium bisulfite	30 gr.	¼ oz. 8 gr.	2 gm.
Hydroquinone	88 gr.	¾ oz. 20 gr.	6 gm.
Sodium carbonate, monohydrated	¼ oz. 65 gr.	1½ oz. 45 gr.	12 gm.
Water to make	32 oz.	1 gal.	1000 c.c.

This type of developer produces a brown stain image in addition to the silver image. Its use has been largely superseded by the general purpose M. Q. developers.

Pyro Tank Developer

Water	48 oz.	1360 c.c.
Sodium sulfite, anh	115 gr.	7.5 gm.
Sodium carbonate, anh	90 gr.	5.8 gm.
Pyro	45 gr.	2.9 gm.

Dissolve immediately before use. Use full strength.
Develop 15 minutes at 68° F. (20° C.).

PHOTOGRAPHIC FORMULAS (Continued)

Glycin Developer (Ansco 72)

This formula provides a highly concentrated stock solution which can be diluted to produce a clean working developer suitable for roll, pack, and sheet film when a long scale of gradation and low maximum density is desired.

Stock Solution

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Sodium sulfite, anh	4¼ oz.	1 lb. 1 oz.	125 gm.
Potassium carbonate	8½ oz.	2 lb. 2 oz.	250 gm.
*Glycin	1½ oz. 75 gr.	6¾ oz.	50 gm.
Water to make	32 oz.	1 gal.	1000 c.c.

* Parahydroxyphenylglycine.

TANK DEVELOPMENT: Take one part stock solution, fifteen parts water and develop 20 to 25 minutes at 68° F. (20° C.).

TRAY DEVELOPMENT: Take one part stock solution, four parts water and develop 5 to 10 minutes at 68° F. (20° C.).

M. Q.—BORAX, Semi-Fine Grain Developers

Elon-Hydroquinone Borax (Kodak D-76)

Developer for full emulsion speed and maximum shadow detail at normal contrast on films and plates.

Water, about 125° F. (52° C.)	24 oz.	96 oz.	750 c.c.
Elon	29 gr.	115 gr.	2 gm.
Sodium sulfite, desiccated	3 oz. 145 gr. (1458 gr.)	13¼ oz.	100 gm.
Hydroquinone	73 gr.	290 gr.	5 gm.
Borax, granular	29 gr.	115 gr.	2 gm.
Water to make	32 oz.	1 gal.	1000 c.c.

Dissolve chemicals in the order given.

Average development time about 17 minutes at 68° F. (20° C.). See individual recommendations listed for each material.

Replenisher (Kodak D-76R)

Water, about 125° F. (52° C.)	24 oz.	96 oz.	750 c.c.
Elon	44 gr.	175 gr.	3 gm.
Sodium sulfite, desiccated	3 oz. 145 gr. (1458 gr.)	13¼ oz.	100 gm.
Hydroquinone	¼ oz.	1 oz.	7.5 gm.
Borax, granular	290 gr.	2 oz. 290 gr.	20 gm.
Water to make	32 oz.	1 gal.	1000 c.c.

Dissolve chemicals in the order given.

Use the replenisher without dilution and add to the tank to maintain the acitivity of the developer, as described for Kodak Replenisher DK-50R.

Metol-Hydroquinone-Borax (Ansco 17)

In addition to its usefulness as a fine-grain developer, this formula is satisfactory for obtaining soft gradation. It is also recommended for motion picture negative development.

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol	22 gr.	88 gr.	1.5 gm.
Sodium sulfite, anh.	2½ oz. 80 gr. (1174 gr.)	10¾ oz.	80 gm.
Hydroquinone	44 gr.	¼ oz. 65 gr.	3 gm.
Borax	44 gr.	¼ oz. 65 gr.	3 gm.
Potassium bromide	7½ gr.	30 gr.	.5 gm.
Water to make	32 oz.	1 gal.	1000 c.c.

Do not dilute for use.

Tank or development time at 68° F. (20° C.), 10 to 15 minutes for fine-grain films, 12 to 20 minutes for direct copy, direct duplicating, and portrait cut films.

Replenisher (Ansco 17A)

Add ¾ ounce of replenisher to Ansco 17A for each roll of 120 film (or equivalent) developed.

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol	32 gr.	129 gr.	2.2 gm.
Sodium sulfite, anh.	2½ oz. 80 gr. (1174 gr.)	10¾ oz.	80 gm.
Hydroquinone	65 gr.	269 gr.	4.5 gm.
Borax	263 gr.	2¼ oz. 75 gr. (1059 gr.)	18 gm.
Water to make	32 oz.	1 gal.	1000 c.c.

Fine Grain Developer for Films and Plates (Kodak DK-20)

This is a true fine grain developer. It produces approximately the same reduction in image graininess as the straight paraphenylenediamine developers, with much less loss in effective film speed, shorter development times, and much lower toxicity.

Water, about 125° F. (52° C.)	96 oz.	750 c.c.
Elon	290 gr.	5 gm.
Sodium sulfite, desiccated	13¼ oz.	100 gm.
Kodalk (sodium metaborate, $4H_2O$)	115 gr.	2 gm.
Sodium thiocyanate (sulfocyanate)	60 gr.	1 gm.
Potassium bromide	30 gr.	.5 gm.
Cold water to make	1 gal.	1000 c.c.

Dissolve chemicals in the order given.

Average development time about 15 minutes in a tank at 68° F. (20° C.). See individual recommendations listed for each material.

The useful life of this developer can be increased 5 to 10 times by use of the following replenisher.

Replenisher (Kodak DK-20R)

Water, about 125° F. (52° C.)	96 oz.	750 c.c.
Elon	1 oz.	7.5 gm.
Sodium sulfite, desiccated	13¼ oz.	100 gm.
Kodalk (sodium metaborate $4H_2O$)	2 oz. 290 gr. (1165 gr.)	20 gm.
Sodium thiocyanate (sulfocyanate)	290 gr.	5 gm.
Potassium bromide	60 gr.	1 gm.
Cold water to make	1 gal.	1000 c.c.

Dissolve chemicals in the order given. The replenisher should be added at a rate which will maintain constant development activity, as described for Kodak Replenisher DK-50R.

Paraphenylenediamine Glycin (Dr. Sease formulas)

	No. 1	No. 2	No. 3	No. 4
Water	32 oz.	32 oz.	32 oz.	32 oz.
Sodium sulfite, dry	3 oz.	3 oz.	3 oz.	3 oz.
*Paraphenylenediamine (base)	146 gr.	146 gr.	146 gr.	146 gr.
**Glycin	......	15 gr.	88 gr.	175 gr.

* Paraphenylenediamine hydrochloride is not interchangeable with the paraphenylenediamine base called for in these formulas.

** Parahydroxyphenyl glycine.

No. 1 gives the finest grain, and requires three to four times normal exposure. The other formulas require about twice normal exposure, develop a film in a shorter time, and give more graininess as the glycin content increases. Formula No. 3 is standard, with a development time of about 20 minutes at 68° F. (20° C.)

CAUTION: Paraphenylenediamine, and solutions containing it, cause skin irritation for many people. Avoid contact with the powder or the developer solution.

Elon-Hydroquinone (Kodak D-11)

High Contrast Developers

Process tank or tray developer for high contrast on films and plates.

Water, about 125° F. (52° C.)	16 oz.	64 oz.	500 c.c.
Elon	15 gr.	60 gr.	1 gm.
Sodium sulfite, desiccated	2½ oz.	10 oz.	75 gm.
Hydroquinone	130 gr.	1 oz. 90 gr.	9 gm
Sodium carbonate, monohydrated	1 oz.	4 oz.	25 gm.
Potassium bromide	75 gr.	290 gr.	5 gm.
Cold water to make	32 oz.	1 gal.	1000 c.c.

Dissolve chemicals in the order given.

For process photography use without dilution. For development of copies of continuous-tone subjects, dilute with an equal volume of water. Develop about 5 minutes in a tank or 4 minutes in a tray at 68° F. (20° C.).

Elon-Hydroquinone (Kodak D-19)

This is a clean-working, long-life, contrast developer which is particularly recommended for use in photomicrography and for the development of films and plates for scientific and technical use.

	U. S. Liquid	**Metric**
Water, about 125° F. (50° C.)	64 oz.	500 c.c.
Elon	115 gr.	2.0 gm.
Sodium sulfite, desiccated	12 oz.	90.0 gm.
Hydroquinone	1 oz. 30 gr.	8.0 gm.
Sodium carbonate, monohydrated	7 oz.	52.5 gm.
Potassium bromide	290 gr.	5.0 gm.
Cold water to make	1 gal.	1.0 l.

Dissolve chemicals in order given.

Develop about 6 minutes in a tank or 5 minutes in a tray at 68° F. (20° C.) according to the contrast desired.

Metol-Hydroquinone (Ansco-30)

This developer is recommended for use with Ansco X-ray films and Ansco aerial films. It is clean-working, has long life and gives high contrast.

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol	51 gr.	¼ oz. 95 gr.	3.5 gm.
Sodium sulfite, anh.	2 oz.	8 oz.	60 gm.
Hydroquinone	¼ oz. 20 gr.	1 oz. 90 gr. (527 gr.)	9 gm.
Sodium carbonate, monohydrated	1¼ oz. 40 gr. (587 gr.)	5¼ oz.	40 gm.
Potassium bromide	29 gr.	117 gr.	2 gm.
Water to make	32 oz.	1 gal.	1000 c.c.

Do not dilute for use.

Normal development time at 68° F. (20° C.), for x-ray film, 6 minutes, for non-screen x-ray film, 8 minutes, for S. S. Pan-Aero film 10–15 minutes depending upon the type of developing machine.

Metol-Hydroquinone (Ansco 90)

This developer has been particularly designed for use with commercial and process films to produce negatives of brilliant contrast.

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol	72 gr.	½ oz. 20 gr.	5 gm.
Sodium sulfite, anh	1¼ oz. 40 gr. (587 gr.)	5 oz.	40 gm.
Hydroquinone	88 gr.	¾ oz. 20 gr.	6 gm.
Sodium carbonate, monohydrated.	1¼ oz. 40 gr. (587 gr.)	5 oz.	40 gm.
Potassium bromide	44 gr.	¼ oz 65 gr.	3 gm.
Water to make	32 oz.	1 gal.	1000 c.c.

Do not dilute for use.

Normal development time, 4 to 6 minutes at 68° F. (20° C.)

Hydroquinone Caustic Soda (Kodak D-8)

Developer for very high contrast on films and plates.

Stock Solution

Water, about 90° F. (32° C.)	24 oz.	96 oz.	750 c.c.
Sodium sulfite, desiccated	3 oz.	12 oz.	90 gm.
Hydroquinone	1½ oz.	6 oz.	45 gm.
Sodium hydroxide (caustic soda)	1¼ oz.	5 oz.	37.5 gm.
Potassium bromide	1 oz.	4 oz.	30 gm.
Water to make	32 oz.	1 gal.	1000 c.c.

Dissolve chemicals in the order given. Stir the solution thoroughly before use.

For use, take 2 parts of stock solution and 1 part of water. Develop about 2 minutes in a tray at 68° F. (20° C.).

For general use, a developer which is slightly less alkaline and gives almost as much density can be obtained by using 410 gr. of sodium hydroxide per 32 oz. of stock solution (28 gm. per 1000 c.c.) instead of the quantity given in this formula.

Paraformaldehyde Developer (Kodak D-85)

This type of developer produces maximum contrast and density, by infectious development, on the fine-grain, high contrast materials used in photomechanical reproduction processes.

PHOTOGRAPHIC FORMULAS (Continued)

Ansco 79 developer is closely similar, except that it calls for potassium metabisulfite instead of sodium bisulfite.

	Avoirdupois	U. S. Liquid	Metric
Water, about 90° F. (30° C.)	64 oz.	2½ gal.	500 c.c.
Sodium sulfite, desiccated	4 oz.	1¼ lbs.	30.0 gm.
Paraformaldehyde	1 oz.	5 oz.	7.5 gm.
Sodium bisulfite	128 gr.	1 oz. 200 gr.	2.2 gm.
*Boric acid crystals	1 oz.	5 oz.	7.5 gm.
Hydroquinone	3 oz.	15 oz.	22.5 gm.
Potassium bromide	90 gr.	1 oz.	1.6 gm.
Water to make	1 gal.	5 gal.	1.0 l.

* Use crystalline boric acid as specified. Powdered boric acid dissolves with great difficulty and its use should be avoided.

Mixing Directions

Use a narrow-mouthed bottle for mixing the developer. First check the volume of the bottle and mark it to indicate the exact level of the quantity of solution to be mixed. Fill the bottle half full of water at about 90° F. (32° C.) and dissolve the chemicals in the order given. After adding each chemical, place the stopper in the bottle so that only a small quantity of air is present during agitation. When all the chemicals have been dissolved, add cold water until the solution comes up to the mark. Insert stopper tightly to exclude as much air as possible. Allow the developer to stand about two hours after mixing. Cool to 68° F. (20° C.) before use. If only a portion of the contents of the bottle is used at one time, it is suggested that the balance be saved by filling a bottle of smaller size which should then be stoppered tightly.

Time of Development: 1½ to 2 minutes at 68° F. (20° C.); see individual recommendations given for each material. With a correctly timed exposure, the image should appear in 30 to 45 seconds at the temperature specified.

This developer has the property of cutting development very sharply in the low densities thus insuring clear dot formation in the halftone negatives.

Elon-Hydroquinone (Kodak D-72)

(Ansco 125 is the same except for approximately 20% lower sodium carbonate content.)

Stock Solution

Water, about 125° F. (52° C.)	16 oz.	64 oz.	500 c.c.
Elon	45 gr.	175 gr.	3 gm.
Sodium sulfite, desiccated	1½ oz.	6 oz.	45 gm.
Hydroquinone	175 gr.	1 oz. 260 gr.	12 gm.
Sodium carbonate, monohydrated	2 oz. 290 gr.	10.5 oz.	80 gm.
Potassium bromide	30 gr.	115 gr.	2 gm.
Water to make	32 oz.	1 gal.	1000 c.c.

Dissolve chemicals in the order given.

For paper: Take stock solution 1 part, water 2 parts, and develop about one minute at 68° F. (20° C.)

For films and plates: Take stock solution 1 part, water 1 part, and develop about 2½ minutes in a tray or 3 minutes in a tank at 68° F. (20° C.)

Universal Developers for Films, Plates, and Papers

Amidol for Films, Plates or Papers

The following developer will give excellent results for plates, films, lantern slides, bromide paper or gaslight paper. It should be dissolved immediately before using, since it keeps only a few hours in solution.

Amidol	25 gr.	1.6 gm.
Sodium sulfite	120 gr.	7.8 gm.
Water	10 oz.	300 c.c.
Potassium bromide	7 gr.	0.5 gm.

The concentration given is satisfactory for any of the purposes mentioned. Develop three to five minutes at a temperature of 68° F. or (20° C.)

Kodelon (Kodak DK-93)

Developer for films, plates, and papers.

Water, about 125° F. (52° C.)	16 oz.	64 oz.	500 c.c.
Kodelon (paraminophenol hydrochloride)	75 gr.	290 gr.	5 gm.
Sodium sulfite, desiccated	1 oz.	4 oz.	30 gm.
Hydroquinone	37 gr.	145 gr.	2.5 gm.
Kodalk (sodium metaborate $4H_2O$)	290 gr.	2 oz. 290 gr.	20 gm.
Potassium bromide	7 gr.	30 gr.	.5 gm.
Cold water to make	32 oz.	1 gal.	1000 c.c.

Dissolve the chemicals in the order given.

Use without dilution. Develop roll films about 9 minutes in a tank of fresh developer at 68° F. (20° C.). Develop professional films and plates about 6 minutes at 68° F. (20° C.). Greater or less contrast may be obtained by developing longer or shorter times than those specified.

For warm tones on papers, use without dilution and develop for 2 minutes at 68° F. (20° C.). For colder tones, double the quantity of Kodalk; use without dilution and develop 1 to 2 minutes at 68° F. (20° C.). In either case, the tones given with this developer are slightly warmer than the normal tones given with Kodak Developers D-52 and D-72.

The use of Kodak DK-93 is especially recommended for those persons subject to trouble from skin irritation.

Developers for Papers

(See also the section on Universal Developers)

Elon-Hydroquinone (Kodak D-52)

Developer for warm tone papers.

	Stock Solution		
Water, about 125° F. (52° C.)	16 oz.	64 oz.	500 c.c.
Elon	22 gr.	90 gr.	1.5 gm.
Sodium sulfite, desiccated	¾ oz.	3 oz.	22.5 gm.
Hydroquinone	90 gr.	350 gr.	6 gm.
Sodium carbonate, monohydrated	250 gr.	2¼ oz.	17 gm.
Potassium bromide	22 gr.	90 gr.	1.5 gm.
Cold water to make	32 oz.	1 gal.	1000 c.c.

Dissolve chemicals in the order given.

For use, take 1 part of stock solution to 1 part of water. Develop about 2 minutes at 68° F. (20° C.).

More bromide may be added if warmer tones are desired.

Metol-Hydroquinone-Glycin (Ansco 130)

This formula is a universal developer for all projection and contact papers. It gives rich black tones with excellent brilliance and detail. It provides unusual latitude in development and is clean-working even with long developing times.

Stock Solution

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol	32 gr.	129 gr.	2.2 gm.
Sodium sulfite anh	1¾ oz.	6¾ oz.	50 gm.
Hydroquinone	159 gr.	1½ oz.	11 gm.
Sodium carbonate, monohydrated	2½ oz.	10½ oz.	78 gm.
Potassium bromide	80 gr.	¾ oz.	5.5 gm.
*Glycin	159 gr.	1½ oz.	11 gm.
Water to make	32 oz.	1 gal.	1000 c.c.

* Parahydroxyphenyl glycine.

The prepared stock solution is clear but slightly colored. The coloration in this case does not indicate the developer has deteriorated or is unfit for use.

For use dilute 1 part stock solution with 1 part water.

Normal developing time 2 to 6 minutes, at 68° F. (20° C.).

Greater contrast can be obtained by using the developer stock solution full strength. Softer results can be obtained by diluting 1 part stock solution with 2 parts water.

High-Temperature Processing

Whenever possible, the temperature of the processing solutions should be held at 65° to 70° F. When this is not practical, special precautions must be taken to avoid excessive swelling and softening.

Most developers, except highly alkaline solutions, can be used up to 75° F. (24° C.), provided the development times are properly shortened and effective hardening rinse and fixing baths are used.

At higher temperatures, the use of Kodak Prehardener SH-5 before development will harden the emulsion sufficiently to allow use of normal solutions and processing procedure, even at temperatures as high as 110° F. (43° C.).

The use of the prehardener is the simplest and safest procedure for processing at high temperatures. When the prehardener is not available, however, the addition of sodium sulfate to the developer solution will permit operation at temperatures up to 90° or 95° F. (32° to 35° C.). Addition of the quantities of sodium sulfate shown in the table below will maintain approximately normal developing times at the higher temperatures. When using any of these developers, it is necessary to observe the following precautions:

1. Developer, stop bath, fixing bath, and wash water must be at the same temperature to within approximately 5° F. (2.5° C.).
2. After development, the film should be treated in a freshly prepared hardening rinse bath, such as Kodak Hardening Bath SB-4. The film should be agitated for several seconds when first immersed in the stop bath, and then left for 3 minutes.
3. The film should be fixed for about 10 minutes in a fresh acid hardening fixing bath, such as Kodak Fixing Bath F-5.
4. The film should be washed for 10 to 15 minutes in running water or in several changes of water. Longer washing may cause trouble.

Kodak Developers	Range of Temperatures	Sodium Sulfate (Desiccated)	
		Per Quart	Per Liter
D-11 D-19	75° to 80° F.	1 oz. 290 gr.	50 gm.
D-76	80° to 85° F.	2½ oz.	75 gm.
	85° to 90° F.*	3 oz. 145 gr.	100 gm.
DK-50	75° to 80° F.	3 oz. 145 gr.	100 gm.
D-72 (1:1)	80° to 85° F.	4 oz. 75 gr.	125 gm.
	85° to 90° F.*	5 oz.	150 gm.

* If necessary to develop at 90° to 90° F., decrease the time about one-third.

Prehardener (Kodak SH-5)

	Avoirdupois U. S. Liquid	**Metric**
Solution A		
Formaldehyde, about 37% solution by weight	1¼ dr.	5 c.c.
Solution B		
Water	28 oz.	900 c.c.
*0.5% solution of Kodak Anti-fog No. 2 (6-nitrobenzimidazoic nitrate)	1¼ oz.	40.0 c.c.
Sodium sulfate, desiccated	1 oz. 290 gr.	50.0 c.c.
Sodium carbonate, monohydrated	175 gr.	12.0 gm.
Water to make	32 oz.	1.0 l.

* To prepare a 0.5% solution, dissolve 18 grains of Kodak Anti-fog No. 2 in 8 ounces of distilled water (1 gram in 200 c.c. of water).

Directions for Mixing: The working solution should be prepared just before using by adding 1¼ drams (5 c.c.) of Solution A to 32 ounces (1 liter) of Solution B and mixing thoroughly.

Directions for Use: Bathe the exposed film in Kodak Prehardener SH-5 for 10 minutes with moderate agitation. Then remove the film from the solution, drain for a few seconds, immerse in water for 30 seconds, drain thoroughly-and immerse in the developer. The selection of the proper developer will depend upon the contrast and the time of development desired. In general up to 90° F. (32° C.), conventional developers such as Kodak D-76, Dk-50, D-19, etc., may be used without modification.

Times of development will be about as follows:

At 75° F. (24° C.)—use the normal development time recommended at 68° F. (20° C.) without prehardening.

At 80° F. (27° C.)—85% of normal time.

At 85° F. (29° C.)—70% of normal time.

At 90° F. (32° C.)—60% of normal time.

At 95° F. (35° C.)—50% of normal time.

Following development, rinse, fix in an acid hardening fixing bath, wash, and dry in the usual way.

At Temperatures Above 95° F. (35° C.) up to 110° F. (43° C.): Increase the concentration of Kodak Anti-Fog No. 2 in the prehardener up to double the normal formula concentration, if necessary, to control fog. Process as before, using a low-activity developer, such as Kodak D-76, to avoid excessively short development times. The average development time at 110° F. (43° C.) after prehardening is about one-quarter of the normal time at 68° F.

In case the development time at elevated temperatures is too short for practical use, sodium sulfate can be added to the developer to extend the time of development.

Keeping Properties: The keeping properties are adequate for ordinary tray and tank practice. Gradual deterioration does occur on standing, but the bath will keep satisfactorily (without use) in a closed bottle for 3 or 4 weeks at 95° F. (35° C.). For most applications, the useful life without replenishment is more than forty 8 × 10-inch films per gallon without serious change in properties.

Pinakryptol Green Desensitizer (Ansco 351)

This solution is not recommended for high speed panchromatic films.

Stock Solution

Pinakryptol green	15 gr.	1 gm.
*Water to make	16 oz.	500 c.c.

For use dilute one part stock desensitizing solution with ten parts water. Immerse films in total darkness for two minutes at 68° F. (20° C.), and then transfer to developing solution.

After one-half of the developing time, films may be inspected for 10 second periods at one-minute intervals; illumination being supplied by a yellow-green safelight placed 2 to 3 feet distant. Desensitized films should be developed approximately 50% longer than non-treated films to obtain comparable gradation and shadow detail.

The same stock solution may be used, if preferred, directly in the developer in the proportion: desensitizer: one part, developer: thirty parts. This procedure should not be followed with developers containing more than 1 gram per liter (15 grains per quart) of hydroquinone.

* Use of a 50-50 water-alcohol mixture for solution will improve the keeping qualities of the desensitizer.

Stock Solution

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol	45 gr.	179 gr.	3 gm.
Sodium sulfite, anh.	1½ oz.	6 oz.	44 gm.
Hydroquinone	169 gr.	1½ oz. 20 gr. (676 gr.)	12 gm.
Sodium carbonate, monohydrated	2¼ oz.	9 oz.	65 gm.
Potassium bromide	30 gr.	119 gr.	2 gm.
Water to make	32 oz.	1 gal.	1000 c.c.

PAPER DEVELOPMENT: Dilute 1 part stock solution with 2 parts water. Develop 1 to 2 minutes at 70° F. (21° C.). For softer and slower development dilute 1 to 4, and develop 1½ to 3 minutes at 70° F. (21° C.). For greater brilliance, shorten the exposure slightly and lengthen the development time. For greater softness, lengthen the exposure slightly and shorten the development time.

Stop Bath (Kodak SB-1) (Ansco 210)

For papers.

Water	32 oz.	1000 c.c.
Acetic acid, 28%	1½ oz.	48 c.c.

To make approximately 28% acetic acid from glacial acetic acid, dilute three parts of glacial acetic acid with eight parts of water.

Rinse prints for at least 5 seconds. Capacity: about twenty 8 × 10-inch prints per quart (1000 c.c.).

Stop Bath (Kodak SB-1a)

(Use after highly alkaline developers)

Water	32 oz.	1000 c.c.
Acetic acid, 28%	4 oz.	125 c.c.

To make approximately 28% acetic acid from glacial acetic acid, dilute three parts of glacial acetic acid with eight parts of water.

The action of this bath checks development instantly, provided the acid has not been neutralized. It also tends to prevent uneven spots and streaks when the prints or negatives are immersed in the fixing bath.

Chrome Alum Hardening Bath (Kodak SB-3) (Ansco 216)

For use at 65° to 75° F. with films and plates.

Water	32 oz.	1000 c.c.
Potassium chrome alum	1 oz.	30 gm.

This bath can be used in place of the regular acetic acid stop bath to give additional hardening to the film. It is particularly desirable in hot weather, for tropical development, and for negatives which have to be enlarged while wet.

Agitate the negatives for a few seconds when first immersed in hardener. Leave them in the bath for 3 to 5 minutes to secure maximum hardening. This bath should be renewed frequently.

Hardening Bath (Kodak SB-4)

For use at 75° to 90° F. with films and plates.

This solution is recommended for use in conjunction with high temperature developers, such as those with sodium sulfate added, when working above 75° F. (24° C.).

Water	32 oz.	1000 c.c.
Potassium chrome alum	1 oz.	30 gm.
*Sodium sulfate, desiccated	2 oz.	60 gm.

* If crystalline sodium sulfate is preferred instead of the desiccated, use 4½ oz. (140 g) in the above formula.

Agitate the negatives for 30 to 45 seconds when they are first immersed in the hardener, or streakiness will result. Leave them in the bath for at least 3 minutes between development and fixation. If the temperature is below 85° F. (29° C.), rinse for 1 to 2 seconds in water before immersing in the hardener bath.

The hardening bath is a violet blue color by tungsten light when freshly mixed, but it ultimately turns a yellow-green with use; it then ceases to harden and should be replaced with a fresh bath. The hardening bath should never be overworked. An unused bath will keep indefinitely, but the hardening power of a partially used bath decreases rapidly on standing for a few days.

Formaldehyde Hardener (Kodak SH-1)

For use prior to aftertreatment (such as reduction or intensification) of films and plates.

Water	16 oz.	500 c.c.
Formaldehyde (about 37% solution by weight)	2½ dr.	10 c.c.
Sodium carbonate, monohydrated	90 gr.	6 gm.
Water to make	32 oz.	1000 c.c.

This formula is recommended for the treatment of negatives which normally would be softened by a chemical treatment as for the removal of stains or for intensification or reduction.

After hardening for three minutes, negatives should be rinsed and immersed for five minutes in a fresh acid fixing bath and then washed thoroughly before they are given any further chemical treatment.

Fixing Bath Non-Hardening; For Special Processes (Kodak F-24)

Water, about 125° F. (52° C.)	16 oz.	500 c.c.
Sodium thiosulfate (hypo)	8 oz.	240 gm.
Sodium sulfite, desiccated	145 gr.	10 gm.
Sodium bisulfite	365 gr.	25 gm.
Cold water to make	32 oz.	1000 c.c.

Dissolve chemicals in the order given.

This bath may be used for films, plates or paper when no hardening is desired.

For satisfactory use, the temperature of the developer, rinse bath, and wash water should not be higher than 68° F. (20° C.).

Acid Hardening Fixer (Ansco 201)

This hardening fixing bath for use with either film or paper may be stored indefinitely and used repeatedly until exhausted. If the fixing bath froths, turns cloudy, or takes longer than 10 minutes to fix out completely, it must be replaced by a fresh solution.

Solution 1			
Hot water (125° F. or 52° C.)	16 oz.	½ gal.	500 c.c.
Hypo	8 oz.	2 lb.	240 gm.
Solution 2			
Hot water (125° F. or 52° C.)	5 oz.	20 oz.	150 c.c.
Sodium sulfite, anh	½ oz.	2 oz.	15 gm.
Acetic acid (28%)	1½ oz.	6 oz.	45 c.c.
Potassium alum	½ oz.	2 oz.	15 gm.
Add solution 2 to 1 and add water to make	32 oz.	1 gal.	1000 c.c.

Dissolve chemicals thoroughly in order given and stir rapidly while adding solution 2 to solution 1. Glacial acetic acid may be diluted to 28% concentration by adding 3 parts of acid to 8 parts of water. Do not dilute for use. Normal fixing time 5 to 10 minutes at 65° to 70° F. (18° to 21° C.).

Acid Hardening Fixing Bath (Kodak F-5)

For films, plates, and papers.

This bath has the advantage over the older type of fixing baths, which do not contain boric acid, that it gives much better hardening and has less tendency to precipitate a sludge of aluminum sulfite.

Water about 125° F. (52° C.)	20 oz.	600 c.c.
Sodium thiosulfate (hypo)	8 oz.	240 gm.
Sodium sulfite, desiccated	½ oz.	15 gm.
*Acetic acid, 28%	1½ oz. fl.	48 c.c.
Boric acid, crystals	¼ oz.	7.5 gm.
Potassium alum	½ oz.	15 gm.
Cold water to make	32 oz.	1000 c.c.

* To make approximately 28% acetic acid from glacial acetic acid, dilute 3 parts of glacial acetic acid with 8 parts of water.

Films or plates should be fixed properly in 10 to 20 minutes in a freshly prepared bath. The bath need not be discarded until the fixing time exceeds 20 minutes. Fix prints 5 to 10 minutes.

In warm weather and in inadequately ventilated darkrooms the odor of sulfur dioxide given off by the Kodak Fixing Bath F-5 may be objectionable. This can be eliminated almost entirely by omitting the boric acid and substituting twice its weight in Kodak Balanced Alkali. This modification is known as Kodak Fixing Bath F-6.

The hardener may also be mixed separately as a stock solution as follows:

Stock Solution for Preparing Kodak Fixing Bath F-5

	Avoirdupois	Metric
Water, about 125° F. (50° C.)	20 oz.	600 c.c.
Sodium sulfite, desiccated	2½ oz.	75.0 gm.
*Acetic acid, 28%	7½ oz.	235.0 c.c.
**Boric acid, crystals	1¼ oz.	37.5 gm.
Potassium alum	2½ oz.	75.0 gm.
Cold water to make	32 oz.	1.0 gm.

* To make approximately 28% acetic acid from glacial acetic acid, dilute 3 parts glacial acetic acid with 8 parts water.

** Crystalline boric acid should be used as specified. Powdered boric acid dissolves only with great difficulty, and its use should be avoided.

Dissolve chemicals in the order given.

Add 1 part of cool stock hardener solution slowly to 4 parts of cool 30% hypo solution (2½ pounds per gallon of solution), while stirring the hypo rapidly.

Rapid Fixing Bath for General Photographic Use (Kodak F-7)

Water, about 125° F. (52° C.)	80 oz.	600 c.c.
Sodium thiosulfate (hypo)	3 lb.	360 gm.
Ammonium chloride	6¾ oz.	50 gm.
Sodium sulfite, desiccated	2 oz.	15 gm.
*Acetic acid, 28%	6 oz. fl.	48 c.c.
Boric acid, crystals	1 oz.	7.5 gm.
Potassium alum	2 oz.	15 gm.
Cold water to make	1 gal.	1000 c.c.

* To make approximately 28% acetic acid from glacial acetic acid, dilute 3 parts of glacial acetic acid with 8 parts of water.

Dissolve chemicals in the order given.

This bath fixes much more rapidly than Kodak F-5 and its useful fixing capacity is considerably greater.

Caution: With rapid fixing baths, do not prolong the fixing time for fine-grain film or plate emulsions or for *any* paper prints; otherwise the image may have a tendency to bleach, especially at temperatures higher than 68° F. (20° C.). This caution is particularly important in the case of warm-tone papers.

Hypo Eliminator

Water	16 oz.	500 c.c.
Hydrogen peroxide (3 percent)	4 oz. fl.	125 c.c.
Ammonia (3 percent)	3¼ oz. fl.	100 c.c.
Water to make	32 oz.	1.0 l.

Directions for use: Wash prints for 30 minutes at 65° F. to 70° F. Immerse each print for 6 minutes in hypo eliminator solution, then wash for 10 minutes and dry. Capacity of bath is about fifty 8 × 10 prints or the equivalent per gallon.

Hypo Test Solution (Kodak HT-2)

For Testing the Degree of Washing of Films and Papers

	Avoirdupois U. S. Liquid	Metric
Water	24 oz.	750 c.c.
*Acetic acid, 28%	4 oz.	125.0 c.c.
Silver nitrate	¼ oz.	7.5 gm.
Water to make	32 oz.	1.0 l.

* To make approximately 28% acetic acid from glacial acetic acid, dilute 3 parts of glacial acetic acid with 8 parts of water.

Store in a screw-cap or glass-stoppered brown bottle away from strong light. Avoid contact of test solution with the hands, clothing, negatives, prints, or undeveloped photographic materials; otherwise black stains will ultimately result.

Test for Washing: After washing, cut off a small strip from the clear margin of the film or print and immerse a portion of it in a small volume of the test solution for about 3 minutes. Any discoloration of the treated strip indicates the presence of hypo, and the degree of stain shows the relative amount of hypo. Well washed films including those for record purposes usually show little or no coloration; with commercially washed films the tint may approach that of dark brown sugar. Well washed prints usually show a slight tint corresponding roughly to that of light brown sugar. A darker tint indicates insufficient washing. After testing, the treated strips should be discarded.

When the washing is known to be fairly thorough, a quick spot test can be made on the face of a print or of a blank piece of paper carried through the processing with the batch of prints. Remove excess water by wiping or blotting the face of the print, apply a drop of the test solution, allow 2 or 3 minutes for the solution to react, and judge immediately the depth of the stain as described above.

NOTE: The excess silver nitrate will darken on exposure to light. Therefore, even if the test shows adequate washing, return the print to the wash water for 2 or 3 minutes in order to remove as much as possible of the test solution.

Tray Cleaner (Kodak TC-1)

	Avoirdupois U. S. Liquid	Metric
Water	32 oz.	1.0 l.
Potassium bichromate	3 oz.	90.0 gm.
*Sulfuric acid (concentrated)	3 oz.	96.0 c.c.

* **Caution**: Always add the sulfuric acid to the solution slowly, stirring constantly, and never the solution to the acid; otherwise the solution may boil and spatter the acid on the hands or face, causing serious burns.

For use, pour a small volume of the tray cleaner solution into the vessel to be cleaned. Rinse around so that the solution has access to all parts of the tray; then pour the solution out and wash the tray 6 or 8 times with water until all traces of the cleaning solution disappear. This solution will remove stains caused by oxidation products of developers and some silver and dye stains. It should *not* be used to clean the hands.

Tray Cleaner and Hand Stain Remover (Kodak TC-3)

Solution A*

	Avoirdupois U. S. Liquid	**Metric**
Water	1 gal.	1.0 l.
Potassium permanganate	¼ oz.	2.0 gm.
†Sulfuric acid (concentrated)	½ oz.	4.0 c.c.

* Store the solution in a stoppered glass bottle away from the light.

† **Caution:** Always add the sulfuric acid to the solution slowly, stirring constantly, and never the solution to the acid; otherwise the solution may boil and spatter the acid on the hands or face, causing serious burns.

Solution B

	Avoirdupois U. S. Liquid	**Metric**
Water	1 gal.	1.0 l.
Sodium bisulfite	4 oz.	30.0 gm.
Sodium sulfite, desiccated	4 oz.	30.0 gm.

The solutions A and B can be used for cleaning several vessels but should be discarded after use.

An acid fixing bath may be used in place of Solution B but it is important to wash thoroughly to eliminate hypo from the tray or hands.

Cleaning Trays: To remove stains due to silver, silver sulfide, and many dyes, pour a small quantity of Solution A into the vessel and allow to remain for a few minutes; rinse well and then replace with a similar volume of Solution B. Agitate so as to clear the brown stain completely, then wash thoroughly.

Cleaning the Hands: To clean stains from the nails and skin, remove rings from the fingers and dip the hands in Solution A contained in a glass or other suitable vessel, gently rubbing the stained areas. Rinse briefly in running water and immerse in Solution B to remove the brown color; then wash throughly, preferably in warm water.

Stain Remover for Removal of Developer Stain on Negatives
(Kodak S-6)

Developer or oxidation stain may be removed by first hardening the film for 2 or 3 minutes in the formalin hardener then washing for 5 minutes and bleaching in:

Stock Solution A

Potassium permanganate	75 gr.	5 gm.
Water to make	32 oz.	1000 c.c.

Stock Solution B

Cold water	16 oz.	500 c.c.
Sodium chloride	2½ oz.	75 gm.
Sulfuric acid (concentrated)	½ oz.	16 c.c.
Water to make	32 oz.	1000 c.c.

Caution: Always add the sulfuric acid to the solution slowly, stirring constantly, and never the solution to the acid; otherwise the solution may boil and spatter the acid on the hands or face, causing serious burns.

Use equal parts of A and B. The solutions should not be mixed until ready for immediate use since they do not keep long after mixing. All particles of permanganate should be dissolved completely when preparing solution A, since undissolved particles are likely to produce spots on the negative. Bleaching should be complete in 3 or 4 minutes at 68° F. (20° C.). The brown stain of manganese dioxide formed in the bleach bath is best removed by immersing the negative in 1% sodium bisulfite solution. Then rinse well and develop in strong light, preferably sunlight, with any general purpose developer. Then wash thoroughly.

Warning: Slow-working developers, such as Kodak D-76, and Kodak DK-20, should not be used since they tend to dissolve the bleached image before the developing agents are able to act on it.

Iron Clearing Solution

To remove yellow stain caused by pyro or hydroquinone developer, wash well to free from hypo and place in

Water	20 oz.	568 c.c.
Ferrous sulfate, pure	3 oz.	85 gm.
Sulfuric acid, C. P.	1 oz.	28 gm.
Powdered alum	1 oz.	28 gm.

until stain is gone, then wash well.

INTENSIFIERS

Mercury Intensifier for Films and Plates (Kodak In-1)

BLEACH the negative in the following solution until it is white, *then wash thoroughly.*

Potassium bromide	¾ oz.	22.5 gm.
Mercuric chloride	¾ oz.	22.5 gm.
Water to make	32 oz.	1000 c.c.

The negative can be blackened with 10% sulfite solution, a developing solution, or dilute ammonia (1 part concentrated ammonia (28%) to 9 parts water), these giving progressively greater density in the order given.

Chromium Intensifier for Films and Plates (Kodak In-4)

Stock Solution

Potassium bichromate	3 oz.	90 gm.
Hydrochloric acid	2 oz. fl.	64 c.c.
Water to make	32 oz.	1000 c.c.

For use, take 1 part of stock solution to 10 parts of water.

Harden the negative first in a formaldehyde hardening solution. Bleach thoroughly at 65° to 70° F. (18° to 21° C.), then wash five minutes and redevelop fully in artificial light or daylight (not sunlight) in any quick-acting, non-staining developer which does not contain an excess of sulfite; for example, about 10 minutes at 68° F. (20° C.) in any general purpose developer. Developers containing a high proportion of sodium sulfite should be avoided. Then rinse, fix for five minutes, and wash thoroughly. Greater intensification can be secured by repeating the process. Negatives intensified with chromium are more permanent than those intensified with mercury.

PHOTOGRAPHIC FORMULAS (Continued)

Silver Intensifier for Films and Plates (Kodak In-5)

The following formula is the only intensifier known that will not change the color of the image on positive film on projection. It gives proportional intensification and is easily controlled by varying the time of treatment. The formula is equally suitable for positive and negative film.

Stock Solution No. 1
(Store in brown bottle)

Silver nitrate, crystals	2 oz.	60 gm.
Distilled water to make	32 oz.	1000 c.c.

Stock Solution No. 2

Sodium sulfite, desiccated	2 oz.	60 gm.
Water to make	32 oz.	1000 c.c.

Stock Solution No. 3

Sodium thiosulfate (hypo)	3½ oz.	105 gm.
Water to make	32 oz.	1000 c.c.

Stock Solution No. 4

Sodium sulfite, desiccated	½ oz.	15 gm.
Elon	365 gr.	25 gm.
Water to make	96 oz.	3000 c.c.

Prepare the intensifier solution for use as follows: Slowly add 1 part of solution No. 2 to 1 part of solution No. 1, shaking or stirring to obtain thorough mixing. The white precipitate which appears is then dissolved by the addition of 1 part of solution No. 3. Allow the resulting solution to stand a few minutes until clear. Then add, with stirring, 3 parts of solution No. 4. The intensifier is then ready for use and the film should be treated immediately. The mixed intensifier solution is stable for approximately 30 minutes at 68° F. (20° C.).

The degree of intensification obtained depends upon the time of treatment which should not exceed 25 minutes. After intensification, immerse the film for 2 minutes with agitation in a plain 30% hypo solution. Then wash thoroughly.

The stability of the mixed intensifier solution and the rate of intensification are very sensitive to changes in the thiosulfate concentration. A more active but less stable working solution may be obtained by using a stock solution No. 3 prepared with 3 oz. of hypo per 32 oz. (90 g per 1000 c.c.) instead of the quantity in the formula. The directions for preparing the working solution are the same as before but the mixed intensifier will not keep over 20 minutes at 68° F. (20° C.).

For best results, the intensifier should be used in artificial light; the solution tends to form a precipitate of silver quite rapidly when exposed directly to sunlight.

REDUCERS

Reducer formulas may be classified into three types, as follows:

1. Subtractive or cutting reducers which remove equal quantities of silver from the high, intermediate, and low densities, respectively. They have the effect of clearing up the shadow areas and therefore appear to increase the image contrast, but they do not change gamma. They are useful for treating fogged or overexposed images. Farmer's reducers and Kodak R-2 are in this group.

2. Proportional reducers which remove density in an amount which is proportional to the original density. They therefore lower

both gamma and visual contrast and correct for overdevelopment. Two solution, Farmer's and Kodak R-5 are in this group.

3. Super-proportional reducers which remove density increments which bear a greater proportion to the original density as the magnitude of the original density increases. They therefore reduce the highlight densities without destroying shadow detail and are useful for treating overdeveloped negatives of contrast subjects. Kodak R-15 is of this type.

Farmer's Reducer (Ansco 310)

This is a cutting reducer for lessening the density of heavy negatives. It is especially valuable for reproduction films to clear the whites.

Solution 1

Hypo	8 oz.	240 gm.
Water to make	32 oz.	1000 c.c.

Solution 2

Potassium ferricyanide	274 gr.	19 gm.
Water to make	8 oz.	250 c.c.

For use mix one part solution 2 and four parts solution 1 in 32 parts water. Solutions 1 and 2 should be stored separately and mixed immediately before use.

Reducer for Clearing Shadow Areas (Kodak R-2)

Stock Solution A

Water	32 oz.	1000 c.c.
Potassium permanganate	1¾ oz.	52.5 gm.

Stock Solution B

Water	32 oz.	1000 c.c.
Sulfuric acid (concentrated)	1 oz. fl.	32 c.c.

Caution: Always add the sulfuric acid to the water slowly, stirring constantly, and never the water to the acid; otherwise the solution may boil and spatter the acid on the hands or face causing serious burns.

The best method of dissolving the permanganate crystals in solution A is to use a small volume of hot water (about 180° F.) (82° C.) and shake or stir the solution vigorously until completely dissolved; then dilute to volume with cold water.

The negative must be thoroughly washed to remove all traces of hypo before it is reduced. For use, take 1 part A, 2 parts B and 64 parts of water. When the negative has been reduced sufficiently, place it in a fresh acid fixing bath for a few minutes, to remove yellow stains, then wash thoroughly.

If reduction is too rapid, use a larger volume of water when diluting the solution for use. This solution should *not be used* as a stain remover as it has a tendency to attack the image before it removes the stain.

The two solutions should not be combined until immediately before use. They will not keep long in combination.

Farmer's Reducer, Proportional, for Lowering Contrast (Kodak R-4b)

Farmer's Reducer also may be used as a two-bath formula by treating the negative in the ferricyanide solution first and subsequently in the hypo solution. This method gives almost proportional reduction and corrects for overdevelopment. The single solution Farmer's Reducer gives only cutting reduction and corrects for overexposure.

Solution A

Potassium ferricyanide	¼ oz.	7.5 gm.
Water to make	32 oz.	1000 c.c.

Solution B

Sodium thiosulfate (hypo)	6¾ oz.	200 gm.
Water to make	32 oz.	1000 c.c.

Treat the negatives in solution A with uniform agitation for 1 to 4 minutes at 65–70° F. (18–20° C.) depending on the degree of reduction desired. Then immerse them in solution B for 5 minutes and wash thoroughly. The process may be repeated if more reduction is desired. For the reduction of general fog, one part of solution A should be diluted with one part of water.

Proportional Reducer for Lowering Contrast (Kodak R-5)

Stock Solution A

Water	32 oz.	1000 c.c.
Potassium permanganate	4 gr.	.3 gm.
Sulfuric acid (10% solution)	½ oz. fl.	16 c.c.

Stock Solution B

Water	96 oz.	3000 c.c.
Potassium persulfate	3 oz.	90 gm.

To make a 10% solution of sulfuric acid, take 1 part of sulfuric acid and add it to 9 parts of water, slowly with stirring. *Never add the water to the acid* because the solution may boil and spatter the acid on the hands or face, cuasing serious burns.

For use, take one part of solution A to three parts of solution B. When sufficient reduction is secured, the negative should be cleared in a 1% solution of sodium bisulfite. Wash the negative thoroughly before drying.

Super-proportional Persulfate Reducer (Kodak R-15)

Stock Solution A

	Avoirdupois U. S. Liquid	**Metric**
Water	32 oz.	1.0 l.
Potassium persulfate	1 oz.	30.0 gm.

Stock Solution B

Water	8 oz.	250 c.c.
*Sulfuric acid (dilute solution)	½ oz.	15 c.c.
Water to make	16 oz.	500 c.c.

* To make: Take 1 part of concentrated sulfuric acid and with caution to avoid contact with the skin, add it slowly to 9 parts of water with stirring. *Never add the water to the acid* because the solution may boil and spatter the acid on the hands or face, causing serious burns.

For use: Take 2 parts of Solution A, and add 1 part of Solution B. Only glass, hard-rubber, or impervious and unchipped enamelware should be used to contain the reducer solution during mixing and use.

Treat the negative in the formaldehyde hardener (Kodak-SH-1 for 3 minutes and wash thoroughly before reduction. Immerse in the reducer with frequent agitation and inspection (accurate control by time is not possible) and treat until the required reduction is almost attained; then remove from the solution, immerse in an acid fixing bath for a few minutes, and wash thoroughly before drying. Used solutions do not keep well and should be promptly discarded.

For best keeping in storage, the persulfate Stock Solution A should be kept away from excessive heat and light. Keeping life of Stock Solution A—about 2 months at 75° F.

TONING FORMULAS

Minor variations in image color, from cold blue-black to warm brown-black, are best obtained by selection of paper type and control of development. Larger variations in color require chemical treatment of the image. The results produced by any one toner formula depend to a considerable extent on the type of paper used and the processing treatment previously given the silver image. In general, cold blue-black silver images tend to be resistant to toning and require the use of very active formulas, such as bleach-and-sulfide redevelop sepia toner. Similarly, warm brown-black silver images generally tone much more readily, and tend to give too yellowish tones with the bleach-and redevelop toner.

Bleach and Redeveloper Sepia Toner (Ansco 221)

This toner is recommended for warm-brown sepia tones.

Solution 1		
Hot water (125° F. or 52° C.)	24 oz.	750 c.c.
Potassium ferricyanide	1½ oz. 80 gr. (736) gr.)	50 gm.
Potassium bromide	144 gr.	10 gm.
Sodium carbonate, monohydrated	289 gr.	20 gm.
Water to make	32 oz.	1000 c.c.
Solution 2		
Sodium sulfide	1½ oz.	45 gm.
Water to make	16 oz.	500 c.c.

For use as described below, dilute one part solution 2 with eight parts water. IMPORTANT—Be sure to use sodium sulfide, not sodium sulfite, in compounding the re-developer. Also, use clean trays, free from exposed iron spots, especially with bleaching bath. Otherwise blue spots may form on prints.

Prints should be washed thoroughly and then bleached in solution 1 until the black image is converted to a very light brown color (about 1 minute). Prints should then be washed for 10 to 15 minutes and redeveloped in diluted solution 2.

Redevelopment should be complete in about 1 minute. After redevelopment the prints should be washed for about 30 minutes and then dried. If the toner should leave sediment which results in streaks or finger marks on the surface of the paper, the print should be immersed for a few seconds in a 3% solution of acetic acid, after which a 10-minute washing is necessary.

Polysulfide Toner (Kodak T-8)

The following single-solution toning bath is recommended for use on all papers except very warm-tone or very cold-tone. It produces slightly darker sepia tones than the redevelopment-sulfide toner, Kodak T-7a, and has the advantage, compared with hypo-alum toners, that it does not require heating, although raising the temperature to 100° F. reduces the time of toning from 15 to 3 minutes.

	Avoirdupoise U. S. Liquid	**Metric**
Water	96 oz.	750 c.c.
Polysulfide (liver of sulfur)	1 oz.	7.5 gm.
Sodium carbonate, monohydrated	145 gr.	2.5 gm.
Water to make	1 gal.	1.0 l.

Dissolve chemicals in the order given.

Immerse the well-washed black-and-white print for 15 to 20 minutes and agitate in the Kodak T-8 bath at 68° F. (20° C.) or for 3 or 4 minutes at 100° F. (38° C.).

After toning, rinse the print for a few seconds in running water and place for about 1 minute in a sodium bisulfite solution containing 1 ounce per quart (30 grams per liter) of water. Then immerse the print for about 2 minutes in a hardening bath prepared by adding 2 parts of Kodak Stock Hardener F-5a to 16 parts of water. If any sediment appears on the print, wipe the surface with a soft sponge. Wash the print for at least 30 minutes before drying.

Approximate capacity of the toning bath is about one hundred and fifty 8 × 10 inch prints (or equivalent) per gallon. When the bath begins to be cloudy, its life can be extended by the addition of the same quantity of carbonate as in the formula.

Hypo Alum Sepia Toner for Papers (Kodak T-1a)

Cold water	90 oz.	2800 c.c.
Sodium thiosulfate (hypo)	16 oz.	480 gm.

Dissolve thoroughly, and add the following solution:

Hot water, about 160° F. (70° C.)	20 oz.	640 c.c.
Potassium alum	4 oz.	120 gm.

Then add the following solution (including precipitate) *slowly to the hypo-alum solution while stirring the latter rapidly.*

Cold water	2 oz.	64 c.c.
Silver nitrate, crystals	60 gr.	4.0 gm.
Sodium chloride	60 gr.	4.0 gm.

After combining above solutions,

Add water to make	1 gal.	4000 c.c.

Note: The silver nitrate should be dissolved completely before adding the sodium chloride and immediately afterward the solution containing the milky white precipitate should be added to the hypo-alum solution as directed above. The formation of a black precipitate in no way impairs the toning action of the bath if proper manipulation technique is used.

For use, pour into a tray supported in a water bath and heat to 120° F. (49° C.). At this temperature prints will tone in 12 to 15 minutes depending on the type of paper. Never use the solution at a temperature above 120° F. (49° C.). Blisters and stains may result. Toning should not be continued longer than 20 minutes at 120° F. (49° C.).

In order to produce good sepia tones, the prints should be exposed so that the print is slightly darker than normal when developed normally (1½ to 2 minutes).

The prints to be toned should be fixed thoroughly and washed for a few minutes before being placed in the toning bath. Dry prints should be soaked thoroughly in water. To insure even toning, the prints should be immersed completely, and separated occasionally, especially during the first few minutes.

After prints are toned, they should be wiped with a soft sponge and warm water to remove any sediment, and washed for one hour in running water.

Nelson Gold Toner (Kodak T-21)

The Nelson Gold Toner has the advantage that a variety of excellent brown tones may be obtained by varying the time of toning; that is, the prints may be removed from the bath at any time when the desired color is reached. It is particularly recommended for use with warm-tone papers.

Stock Solution A

	Avoirdupois U. S. Liquid	**Metric**
Warm water, about 125° F. (50° C.)	1 gal.	4.0 l.
Sodium thiosulfate (hypo)	2 lb.	960.0 gm.
Potassium persulfate	4 oz.	120.0 gm.

Dissolve the hypo completely before adding the potassium perpersulfate. Stir the bath vigorously while adding the potassium persulfate. If the bath does not turn milky, increase the temperature until it does.

Prepare the following solution and add it (including precipitate) slowly to the hypo-persulfate solution while stirring the latter rapidly. *The bath must be cool when these solutions are added together.*

Cold water	2 oz.	64.0 c.c.
Silver nitrate, crystals	75 gr.	5.0 gm.
Sodium chloride	75 gr.	5.0 gm.

Note: The silver nitrate should be dissolved completely before adding the sodium chloride.

Stock Solution B

Water	8 oz.	250.0 c.c.
Gold chloride	15 gr.	1.0 gm.

For use, add 4 ounces (125 c.c.) of Solution B slowly to Solution A while stirring the latter rapidly.

The bath should not be used until after it has become cold and has formed a sediment. Then pour off the clear liquid for use.

Pour the clear solution into a tray supported in a water bath and heat to 110° F. (43° C.). During toning the temperature should be between 100° and 110° F. (38° and 43° C.).

Prints to be toned should be washed for a few minutes after fixing before they are placed in the toning solution. Dry prints should be soaked thoroughly in water before toning.

Keep at hand an untoned black-and-white print for comparison during toning. Prints should be separated at all times to insure even toning.

When the desired tone is obtained (5 to 20 minutes), remove and rinse the prints in cold water. After the prints have been toned, return them to the fixing bath for 5 minutes, then wash for 1 hour in running water.

The bath should be revived at intervals by the addition of Gold Solution B. The quantity to be added will depend upon the number of prints toned and the time of toning. For example, when toning to a warm brown, add 1 dram (4 c.c.) of gold solution after each fifty 8 × 10 inch prints or their equivalent have been toned. Fresh solution may be added from time to time to keep the bath up to the proper volume.

Prints toned in Nelson Gold Toner should be kept from excessive exposure to heat or intense light.

Gold Toner for Red or Blue Tones (Ansco 231)

This formula gives a range of red tones to sepia-toned prints, the brilliance of the tone depending on the paper used. If desired, deep blue tones may also be obtained with this formula by using black-and-white prints instead of prints that have first been sepia-toned. Unusual effects of mixed tones of blue-black shadows and soft reddish highlights can be produced by using prints which have been partially toned in a hypo alum speia-toner.

Hot water (125° F. or 52° C.)	24 oz.	750 c.c.
*Ammonium sulfocyanate	3½ oz.	105 gm.
Gold chloride, 1% solution	2 oz. fl.	60 c.c.
Water to make	32 oz.	1000 c.c.

* May be substituted by:

Sodium sulfocyanate	3¾ oz.	110 gm.
or		
Potassium sulfocyanate	4½ oz.	135 gm.

For Red Tones: Prints must first be bleached and toned by sulfide redevelopment method. After washing, place prints in above solution until toning is complete (requires 15–45 minutes). For redder tones one-half the specified amount of sulfocyanate may be used.

For Deep Blue Tones: Omit sepia toning operation and place well-washed black-and-white prints directly in above toning solution.

For Mixed Tones: Prints should be incompletely toned in a hypo alum toner and washed before treatment in above solution.

Iron Toner for Blue Tones on Papers (Kodak T-12)

Ferric ammonium citrate (green scales)	58 gr.	4 gm.
Oxalic acid, crystals	58 gr.	4 gm.
Potassium ferricyanide	58 gr.	4 gm.
Water to make	32 oz.	1000 c.c.

Dissolve each chemical separately in a small volume of water, about 8 oz. (250 c.c.) and filter before mixing together. This solution does not keep well except in brown bottles.

Immerse the well-washed print in the toning bath for 10 to 15 minutes until the desired tone is obtained. Then wash until the highlights are clear.

BLUE PRINT PAPER, FORMULAS FOR SENSITIZING

1

Solution A

Water	8.5 oz.	50 c.c.
Iron and ammonium citrate	1.7 oz.	10 gm.

Solution B

Water	8.5 oz.	50 c.c.
Potassium ferricyanide	1.4 oz.	8 gm.

Filter separately. The solutions, which may be preserved separately for some time, are best kept in the dark. For use, mix, in a dark room or by an artificial light of low intensity, equal quantities of the two solutions.

Any non-absorbent paper may be sensitized by brushing the solution over it rapidly with a soft, wide, flat brush, going over the surface twice, the second coat being applied in a direction at right angles to the first. An alternative method is to lower the paper, beginning at one edge, on to the surface of the solution in a tray and allow it to float for a few seconds. Care must be taken to exclude air bubbles. After sensitizing by either method, the paper should be hung by one edge in a dark room to dry.

2

Blue printing depends to a large extent upon surface of paper. The following formula is recommended as producing clear whites:

Solution 1	
Potassium ferricyanide, $K_3Fe(CN)_6$	10 gm.
Distilled water	100 c.c.

Solution 2	
Iron and ammonium citrate (ferric)	30 gm.
Water	100 c.c.
Gum arabic (gum acacia)	5 gm.

Equal parts of the above solutions are mixed just before use. The paper to be sensitized may be floated on the surface or the liquid may be applied with a tuft of absorbent cotton using cross strokes to insure an even coating. The sensitized paper must be dried in the dark and should be used within 36 hours.

ULTRAVIOLET SENSITIZATION

Silver Sensitizer for Cloth, etc.

Photographic plates can be made sensitive to short-wave ultraviolet light by immersion in a dilute solution of citric acid in 95% ethyl alcohol (1% citric acid). (Sodium salicylate may be substituted for the citric acid.) The plate is immersed in the citric acid solution and immediately withdrawn and dried in less than one minute by waving in the air before putting in the holder. After exposure the plate can be developed without previous washing and without special precautions. The coating of citric acid adheres to the plate so that a number of plates may be treated and stored away for future use. Citric acid has no detrimental action on the emulsion or the developer. The sharpness of the image is not diminished.

Sensitizer for Paper, Cloth, and Similar Fabrics

Many sensitizing formulas have appeared in the photographic literature, most of them being minor variations of a few basic types. Most of them will give acceptable results but the following formula has been found to be particularly dependable as well as easy to prepare and use. The ferric ammonium citrate and the silver nitrate which it calls for can be purchased through Kodak dealers. The tartaric acid can be obtained from a druggist.

Sensitizer Formula

	Avoirdupois U. S. Liquid	Metric
Ferric ammonium citrate	3 oz.	90 gm.
Tartaric acid	½ oz.	15 gm.
Silver nitrate	1¼ oz.	37.5 gm.
Water to make	32 oz.	1.0 l.

PHOTOGRAPHIC FORMULAS (Continued)

Mixing: Dissolve each of the chemicals separately in about 8 ounces of water. Mix the ferric ammonium citrate and the tartaric acid solutions and then add the silver nitrate solution slowly while stirring. Keep the solution in a brown glass bottle away from direct light. Under such conditions, the mixed solution will keep in good condition for several months.

Application: The sensitizing of the fabric or paper can be done in artificial light but it is best to work under a yellow light such as from a Wratten Safelight Series 00. The paper or fabric can be dipped in the solution and then hung up in a dark room to dry. If preferred, the sensitizing solution can be swabbed onto the surface with a tuft of absorbent cotten or a soft brush. In order to be certain of an even application, the sensitizing solution should first be spread with vertical strokes of the brush and then the surfaces reworked with horizontal strokes. The paper or fabric should then be pressed between two blotters to remove any excess of the sensitizer and then dried in a dark place which is free from dust.

Since the sensitizing formula contains silver nitrate, it is best to wear rubber gloves to prevent contact with the hands or fingers. Otherwise, black stains, which are very difficult to remove, will develop several hours afterwards.

A good brush or swab for applying the sensitizer can be made by folding several thicknesses of a soft, well-washed cotton cloth around the end of a piece of glass, about 2 inches wide by 6 inches long, and holding it in place with a rubber band.

Printing: After drying, the sensitized sheet is held in close contact under the desired negative and exposed to sunlight or very strong artificial light. It is preferable to use a spring printing frame to insure good contact with the negative. The exposure should be continued until details are visible in the highlight areas.

Development: After printing, wash the sensitized sheet for about 1 minute in running water. The resulting image will be a rather disagreeable yellow color but this will gradually intensify and change to a more pleasing brown when the print is allowed to dry in daylight. If preferred, after the preliminary water wash, the print can be immersed in a plain hypo solution containing 1 ounce of hypo to 20 ounces of water. This will change the image color to an excellent Van Dyke brown. Since the treatment in the hypo solution tends to reduce the density of the image, it is often useful for saving an overexposed print. If an almost black image is desired, the print can be washed as above and then ironed with a hot flatiron.

PLATE AND FILM SPEEDS

Compiled with the collaboration of
Chas. H. Shipman

In 1900 two English amateurs, Messrs. Hurter and Driffield, proposed a system of plate speeds based on the assumption that, if a plate is given a series of graded exposures, and developed in a pyro developer free from bromide, a density-log exposure curve may be plotted from which a speed value may be determined which is supposed to be inversely proportional to the exposure required to produce average density. The Scheiner system is based upon the assumption that speeds are inversely proportional to the exposure necessary to produce a just visible image. It will be evident that these two systems cannot be compared exactly.

Kodak Film Speeds are determined by a system of testing in which the exposure on which the speed number is based is taken as the value of exposure for which the slope at the lower part of the characteristic curve is three-tenths the average slope over an exposure range of 30: 1 which is found to be the maximum contrast for the average scene.

The American Standards Association speeds are determined by a method essentially the same as that for measuring Kodak speeds.

There can be no simple relationship between speeds obtained in fundamentally different ways and the conversion table given below can be considered only a rough guide.

Comparison of Speed Systems

The following table shows values of exposure index in various systems corresponding to those of the American Standards Association.

American Standards Association	General Electric	Weston	H and D	American Scheiner	German Scheiner	Din	Relative Exposures
		.3	7.5	4	10

PLATE AND FILM SPEEDS

The following table presents the most recent figures available at the time of compilation for speed numbers in the American Standards Association, Weston, and General Electric systems. Values are given for daylight and for tungsten or photoflood illumination.

Speed values given can be considered only as a general guide. Figures given by different authorities differ somewhat according to the characteristics of negatives considered satisfactory. In general the speed numbers are given for full exposure.

In reading from a grey card of 18% reflectivity the result will be a meter reading approximate to a reading on the object if in mazda light. The reading from a white card of 90% reflectivity will be about five times as high, and, therefore, a value only one fifth as for a direct reading will be chosen.

In using the grey or white card it must be placed near the object and must fill the intake cone of the meter and must be free from shadow.

In copying line drawings the speed tables will not be accurate and will serve only as a guide for experiment. High contrast material must be used and, as it has small latitude, the exposure must be such as will keep the line clear and the rest as dark as possible.

In copy work account must be taken of the extended bellows. To get the actual f value of the stop being used divide the distance from the lens to film by the focal length of the lens and multiply the result by the f value of the indicated stop.

ALLOWABLE CARRYING CAPACITIES OF CONDUCTORS

(National Electrical Code)

The ratings in the following tabulation are those permitted by the National Electrical Code for flexible cords and for interior wiring of houses, hotels, office buildings, industrial plants, and other buildings.

The values are for copper wire. For aluminum wire the allowable carrying capacities shall be taken as 84 % of those given in the table for the respective sizes of copper wire with the same kind of covering.

Size A.W.G.	Area Circular Mils	Diameter of Solid Wires Mils	Rubber Insulation Amperes	Varnished Cambric Insulation Amperes	Other Insulations and Bare Conductors Amperes
18	1,624.	40.3	3*	...	6†
16	2,583.	50.8	6*	...	10†
14	4,107.	64.1	15	18	20
12	6,530.	80.8	20	25	30
10	10,380.	101.9	25	30	35
8	16,510.	128.5	35	40	50
6	26,250.	162.0	50	60	70
5	33,100.	181.9	55	65	80
4	41,740.	204.3	70	85	90
3	52,630.	229.4	80	95	100
2	66,370.	257.6	90	110	125
1	83,690.	289.3	100	120	150
0	105,500.	325.0	125	150	200
00	135,100.	364.8	150	180	225
000	167,800.	409.6	175	210	275
0000	211,600.	460	225	270	325

1 Mil = 0.001 inch.

* The allowable carrying capacities of No. 18 and 16 are 5 and 7 amperes respectively, when in flexible cords.

† The allowable carrying capacities of No. 18 and 16 are 10 and 15 amperes respectively, when in cords for portable heatsrs. Types AFS, AFSJ, HC, HPD, and HSJ.

CROSS-SECTION AND MASS OF WIRES

U. S. Measure

Diameters are given in mils (1 mil = .001 in.), and area in square mils (1 sq. mil = .000001 sq. in.). For sections and masses for one-tenth the diameters given, divide by 100 and for sections and masses for ten times the diameter multiply by 100.

CROSS-SECTION AND MASS OF WIRES (Continued)

Metric Measure

Diameters are given in thousandths of a centimeter and area of section in square thousandths of a centimeter. 1 (cm/1000)² = .000001 sq. cm For sections and masses for diameters 1/10 or 10 times those of the table, divide or multiply by 100.

Diam. in thousandths of a cm	Cross-section in square thousandths of a cm	Grams per meter

CROSS-SECTION AND MASS OF WIRES (Continued)

Metric Measure (Continued)

Diameters are given in thousandths of a centimeter and area of section in square thousandths of a centimeter. 1 (cm/1000)^2 = .000001 sq. cm. For sections and masses for diameters 1/10 or 10 times those of the table, divide or multiply by 100.

Diam. in thousandths of a cm	Cross-section in square thousandths of a cm	Grams per meter

RESISTANCE OF WIRES

The following table gives the approximate resistance of various metallic conductors. The values have been computed from the resistivities at 20°C, except as otherwise stated, and for the dimensions of wire indicated. Owing to differences in purity in the case of elements and of composition in alloys, the values can be considered only as approximations.

The following dimensions have been adopted in the computations.

B. & S. gauge	Diameter mm	Diameter mils 1 mil = .001 in.	B. & S. gauge	Diameter mm	Diameter mils 1 mil = .001 in.

(1.06inch)**	26.9	1.06	±3	+5	3.43 to 4.50	.135 to .177
1 -inch	25.4	1.00	±3	+5	3.43 to 4.50	.135 to .177
$\frac{7}{8}$-inch	22.2	.875	±3	+5	3.23 to 4.22	.127 to .166
$\frac{3}{4}$-inch	19.1	.750	±3	+5	3.10 to 3.91	.122 to .154
$\frac{5}{8}$-inch	15.9	.625	±3	+5	2.74 to 3.43	.108 to .135
(0.530inch)**	13.4	.530	±3	+5	2.39 to 3.10	.094 to .122
$\frac{1}{2}$-inch	12.7	.500	±3	+5	2.39 to 3.10	.094 to .122
$\frac{7}{16}$-inch	11.1	.438	±3	+5	2.23 to 2.84	.088 to .112
$\frac{3}{8}$-inch	9.52	.375	±3	+5	2.11 to 2.59	.083 to .102
$\frac{5}{16}$-inch	7.93	.312	±3	+5	1.85 to 2.36	.073 to .093
(0.265inch)**	6.73	.265	±3	+5	1.60 to 2.11	.063 to .083
$\frac{1}{4}$-inch (No. 3)	6.35	.250	±3	+5	1.60 to 2.11	.063 to .083

** The five sieves marked in the first column with a double asterisk (**) may be used instead of the 4-inch, 2-inch, 1-inch, $\frac{1}{2}$-inch, and $\frac{1}{4}$-inch sieves when it is desired to have a series of sieves nesting with the Fine Series and continuing that series with the $\sqrt{2}:1$ ratio. All of the other sieves listed above are in a $\sqrt[4]{2}:1$ ratio with the Fine Series within the limit of the specified permissible variations. Care should be taken in designating the five sieves marked with the double asterisk; they should not be designated as 4-inch, 2-inch, 1-inch, $\frac{1}{2}$-inch, and $\frac{1}{4}$-inch, but as 4.24-inch, 2.12-inch, 1.06-inch, 0.530-inch and 0.265-inch (or by the manufacturer's nominal values, e.g. for the last three, 1.050-inch, 0.525-inch, and 0.263-inch).

62 micron (No. 230)	.062	.0024	±7	+90[a]	.039 to .052	.0015 to .0020
53 micron (No. 270)	.053	.0021	±7	+90[a]	.035 to .046	.0014 to .0018
44 micron (No. 325)	.044	.0017	±7	+90[a]	.031 to .040	.0012 to .0016
37 micron (No. 400)	.037	.0015	±7	+90[a]	.023 to .035	.0009 to .0014

[a] Note: For sieves from the 1000 micron (No. 18) to the 37 micron (No. 400) size, inclusive, not more than 5% of the opening shall exceed the nominal opening by more than one-half of the permissible variations in maximum opening.

These sieve series will meet the specifications of the National Bureau of Standards LC-584.

American Society for Testing Materials E11-39.

American Standards Association Z 23, 1-1939.

American Association of State Highway Officials T-27.

Federal Specification RR-S-366a 4-29-42.

TYLER STANDARD SCREEN SCALE SIEVES

In the following table the Tyler Standard Screen Scale Sieves Series has been expanded to include intermediate sieves for closer sizing which gives a ratio of the fourth root of two or 1.189 between openings in successive sieves.

Tyler Standard Screen Scale Sieves and U. S. Sieves can be used interchangeably.

Tyler Standard Screen Scale $\sqrt{2}$ Opening in Inches	For Closer Sizing Ratio $\sqrt[4]{2}$ Opening in Inches	Mesh	Diameter of Wire, Decimal of an Inch	U. S. Series Equivalents (Fine Series)

ACCELERATION DUE TO GRAVITY AND LENGTH OF THE SECONDS PENDULUM

For Sea Level at Various Latitudes

Based on the formula of the U. S. Coast and Geodetic Survey. The length of the simple pendulum whose period is two seconds, that is which beats seconds, is computed in each case from the corresponding value of the acceleration.

Latitude	Acceleration due to gravity		Length of seconds pendulum	
°	cm/sec.^{2}	ft./sec.^{2}	cm	in.

DATA IN REGARD TO THE EARTH

Equatorial radius, 6,378,388 meters, 3,963.34 miles.

Polar radius, 6,356,912 meters, 3,949.99 miles.

Radius of sphere having same volume, 6,371,221.3 meters, 3,958.89 miles.

Quadrant of the equator, 10,019,148.4 meters, 6,225.60 miles.

Quadrant of the meridian, 10,002,288.3 meters, 6,215.12 miles.

1° latitude at the equator = 68.70 miles.

1° latitude at the pole = 69.41 miles.

Mean density of the earth, 5.522 g/cm^3, 344.7 lb./ft.^{3}

Mass of the earth, 5.983×10^{24} kg, 6.595×10^{21} tons.

Mean surface density of the continents, 2.67 g/cm^3, 166.7 lb./ft.^{3}

Mean linear velocity of the earth in its orbit, 29.77 km/sec., 18.50 mi./sec.

Mean linear velocity of rotation of the surface at the equator, 0.465 km/sec., 0.289 mi./sec.

Land area, 148.847×10^6 km^2, 57.470×10^6 sq. mi.

Ocean area, 361.254×10^6 km^2, 139.480×10^6 sq. mi.

Highest mountain, Everest, 8840 meters, 29,003 ft.

Greatest sea depth, 10,430 meters, 34,219 ft.

Thermal gradient of the earth, higher at increasing depths, 30° C per km, 48° C per mi. (uncertain).

Mean distance to the sun, 149,500,000 km or 92,900,000 mi.

Mean distance to the moon, 384,393 km or 238,854 mi.

THE COMMONER CHEMICAL ELEMENTS IN THE EARTH'S CRUST

Reprinted from "Principles of Geochemistry" (1952) with the permission of Brian Mason, author, and John Wiley and Sons, publishers.

The "Earth's Crust" refers to the rocks only and does not include atmosphere or the oceans. The atom percent column is obtained by dividing the weight percent by the atomic weights and reducing to 100%. The radius is the ionic radius. The volume percent is the atomic percent multiplied by $\frac{4}{3}\pi r^3$ and reducing to 100%.

Element	Weight %	Atom %	Ion Radius (Å)	Volume %
O	46.60	62.55	1.32	91.97

ATMOSPHERIC AND METEOROLOGICAL DATA

Total mass of the atmosphere, estimated by Ekholm 5.2×10^{21} g, 11.4×10^{18} pounds, 5.70×10^{16} tons.

Evidence of extent: twilight, 63 km, 39 mi.; meteors, 200 km, 124 mi.: aurora 44–360 km, 27–224 mi.

Height if homogeneous at normal atmospheric pressure, 7991 m, 4.965 mi.

Composition of the atmosphere, mean percentage by volume, at sea level, of the dry air components.

N_2	78.03	H_2	0.01

* Distance to Earth.

STANDARD ATMOSPHERE

A standard atmosphere for heights up to 20 kilometers has been approved by the International Civil Aviation Organization and the National Advisory Committee on Aeronautics. The values correspond fairly well to average values observed at 40° N in North America. For basic assumptions regarding values in this table refer to Manual of the I C A O Standard Atmosphere, N A C A Technical Note, Washington 25, D. C., May 1954.

Altitude		Temperature °K	Pressure millibars	Density g/cm³	Viscosity poise	Speed of sound meters/sec

Atmospheric Electricity

Normal potential gradient:
  Over land, 67 to 317 volts/m.
  Over sea, 128 volts/m.
Potential gradient at Earth's surface beneath thunder cloud, 1×10^4 volts/m.
Quantity discharged by lightning flash, 10–50 coulombs.
Energy of flash, 1×10^{17} ergs.
Potential difference between discharge points, 1×10^9 volts.

Angular Radius of Halos and Rainbows

Coronae due to small water drops................	1° to 10°
Small halo, due to 60° angles of ice crystals........	22°
Large halo, due to 90° angles of ice crystals.......	46°
Rainbow, primary............................	41° 20′
Rainbow, secondary..........................	52° 15′

Solar Constant

The energy falling on one sq. cm. area at normal incidence, outside the earth's atmosphere, at the mean distance of the earth from the sun equals 2.00 small calories per minute. This value varies ±2%.

MOLECULAR CONSTANTS

The following gives the arithmetical average velocity, the mean free path, molecular diameter and collision frequency for the temperatures indicated and at standard pressure, 760 mm Hg. except as otherwise stated.

Gas	Average velocity in cm/sec.		Mean free path in cm at 75 cm Hg.		
	0° C	20° C	Boltzmann		Meyer
			0° C	20° C	20° C

VALUES OF THE GENERAL PHYSICAL CONSTANTS*

Raymond T. Birge, Reviews of Modern Physics **13**, 233, 1941

Table A. Principal Constants and Ratios*

Section		
A	Velocity of light	$c = (2.99776 \pm 0.00004) \times 10^{10}$ cm · sec^{-1}
B	Gravitation constant	$G = (6.670 \pm 0.005) \times 10^{-8}$ dyne · cm^2 · g^{-2}
C	Liter (=1000 ml)	$l = 1000.028 \pm 0.002$ cm^3
D	Volume of ideal gas (0°C, A_0)	$V_0 = (22.4146 \pm 0.0006) \times 10^3$ cm^3 · atmos · mole^{-1} $V_0' = 22.4140 \pm 0.0006$ liter · atmos · mole^{-1}
D	Volume of ideal gas (0°C, A_{45})	$V_{45} = (22.4157 \pm 0.0006) \times 10^3$ cm^3 · atmos · mole^{-1} $V_{45}' = 22.4151 \pm 0.0006$ liter · atmos · mole^{-1}
E	International ohm (= p abs-ohm)	$p = 1.00048 \pm 0.00002$ (U. S. Int. ohm 1948, $p = 1.000495$)
E	International ampere (= q abs-amp)	$q = 0.99986 \pm 0.00002$ (U. S. Int. ampere 1948, $q = 0.999835$)
F	Atomic weights (see Table A′)	
G	Standard atmosphere	$A_0 = (1.013246 \pm 0.000004) \times 10^6$ dyne · cm^{-2} · atmos^{-1}
G	45° atmosphere	$A_{45} = (1.013195 \pm 0.000004) \times 10^6$ dyne · cm^{-2} · atmos^{-1}
H	Ice-point (absolute scale)	$T_0 = 273.16 \pm 0.01$°K
I	Joule equivalent	$J_{15} = 4.1855 \pm 0.0004$ abs-joule · cal$_{15}^{-1}$
I	Joule equivalent (electrical)	$J_{15}' = 4.1847 \pm 0.0003$ int-joule · cal$_{15}^{-1}$
J	Faraday constant	
K	Avogadro number (chemical scale)	$N_0 = (6.0228_3 \pm 0.0011) \times 10^{23}$ mole^{-1}
K	Electronic charge	$e = F/N_0 = (1.60203_3 \pm 0.00034) \times 10^{-20}$ abs. e.m.u. $e' = ec = (4.80251 \pm 0.0010) \times 10^{-10}$ abs. e.s.u.
L	Specific electronic charge	$e/m = (1.7592 \pm 0.0005) \times 10^7$ abs. e.m.u. · g^{-1} $e'/m = ec/m = (5.2736_6 \pm 0.0015) \times 10^{17}$ abs. e.s.u. · g^{-1}
M	Planck constant	h (see Table C).

Faraday constant (J):

(1) Chemical scale

$F = 96501._2 \pm 10$ int-coul · g-equiv^{-1}

$= 96487._7 \pm 10$ abs-coul · g-equiv^{-1}

$= 9648.7_7 \pm 1.0$ abs. e.m.u. · g-equiv^{-1}

$F' = Fc = (2.89247 \pm 0.00030) \times 10^{14}$ abs. e.s.u. · g-equiv^{-1}

(2) Physical scale

$F = 96514._0 \pm 10$ abs-coul · g-equiv^{-1}

$= 9651.4_0 \pm 1.0$ abs. e.m.u. · g-equiv^{-1}

$F' = Fc = (2.89326 \pm 0.00030) \times 10^{14}$ abs. e.s.u. · g-equiv^{-1}

---

* Unless otherwise specified, all quantities in these tables that involve the mole or the gram equivalent are on the chemical scale of atomic weights.

VALUES OF THE GENERAL PHYSICAL CONSTANTS (Continued)

Table A′. Atomic Weights

(1) Physical scale ($O^{16} = 16.0000$)

$H^1 = 1.00813 \pm 0.00001_7$ $H^2 = 2.01473 \pm 0.00001_9$
$H = 1.00827_6 \pm 0.00001_7$ (from H^1/H^2 abundance $= 6900 \pm 100$)
$He^4 = 4.00389 \pm 0.00007$
$C^{12} = 12.00386 \pm 0.00004$ $C^{13} = 13.00761 \pm 0.00015$
$C = 12.01465 \pm 0.00023$ (from C^{12}/C^{13} abundance $= 92 \pm 2$)
$N^{14} = 14.00753 \pm 0.00005$ $N^{15} = 15.0049 \pm 0.0002$
$N = 14.01121 \pm 0.00009_5$ (from N^{14}/N^{15} abundance $= 270 \pm 6$)
$O^{16} = 16\ 0000$ $O^{17} = 17.0045$ $O^{18} = 18.0049$
$O = 16.00435_7 \pm 0\ 00008_6$ (from abundance $O^{16}:O^{18}:O^{17} = (506 \pm 10):1:(0.204 \pm 0.008)$)

(2) Chemical scale ($O = 16.0000$)

Ratio physical to chemical scale

$$r = (16.004357 \pm 0.000086)/16 = 1.000272 \pm 0.000005$$

$H^1 = 1.00785_6 \pm 0.00001_8$ (from physical scale)
$H^2 = 2.01418_2 \pm 0.00002_1$ (from physical scale)
$H = 1.00800_2 \pm 0.00001_8$ (from physical scale)
$He^4 = 4.00280 \pm 0.00007$ (from physical scale)
$C = 12.01139 \pm 0.00024$ (from physical scale)
$N = 14.00740 \pm 0.00012$ (from physical scale)
$N = 14.0086 \pm 0.0007$ (direct observation)
$Na = 22.994 \pm 0.003$ $Cl = 35.457 \pm 0.001$
$Ca = 40.080 \pm 0.005$ $Ag = 107.880 \pm 0.002$ $I = 126.915 \pm 0.004$

VALUES OF THE GENERAL PHYSICAL CONSTANTS (Continued)

Table B. Additional Quantities Evaluated or Used in Connection with Table A

Section			
A	Ratio of e.s.u. to e.m.u. (direct)	c'	$= (2.9971_2 \pm 0.0001) \times 10^{10}\ \mathrm{cm}^{1/2} \cdot \mathrm{sec}^{-1/2} \cdot \mathrm{int\text{-}ohm}^{1/2}$ $= (2.9978_4 \pm 0.0001_0) \times 10^{10}\ \mathrm{cm} \cdot \mathrm{sec}^{-1}$
A	Ratio of e.s.u. to e.m.u. (indirect)	$c' = c$	$= (2.99776 \pm 0.00004) \times 10^{10}\ \mathrm{cm} \cdot \mathrm{sec}^{-1}$
B	Average density of earth	δ	$= 5.517 \pm 0.004\ \mathrm{g} \cdot \mathrm{cm}^{-3}$
C	Maximum density of water	$\delta\, m(\mathrm{H_2O})$	$= 0.999972 \pm 0.000002\ \mathrm{g} \cdot \mathrm{cm}^{-3}$
D	Acceleration of gravity (standard)	g_0	$= 980.665\ \mathrm{cm} \cdot \mathrm{sec}^{-2}$
D	Acceleration of gravity (45°)	g_{45}	$= 980.616\ \mathrm{cm} \cdot \mathrm{sec}^{-2}$
D	Density of oxygen gas (0°C, A_{45})	L_1	$= 1.42897 \pm 0.00003\ \mathrm{g} \cdot \mathrm{liter}^{-1}$
D	Limiting density of oxygen gas (0°C, A_{45})	L_{lim}	$= 1.427609 \pm 0.000037\ \mathrm{g} \cdot \mathrm{liter}^{-1}$
D	Factor converting oxygen (0°C, A_{45}) to ideal gas	$1 - \alpha$	$= 1.000953_5 \pm 0.000009_4$
E	International coulomb ($= q$ abs-coul)	q	$= 0.99986 \pm 0.00002$ (U. S. Int. coulomb 1948, $q = 0.999835$)
E	International gauss ($= q$ abs-gauss)		
E	International henry ($= p$ abs-henry)	p	$= 1.00048 \pm 0.00002$ (U. S. Int. henry 1948, $q = 1.000495$)
E	International volt ($= pq$ abs-volt)	pq	$= 1.00034 \pm 0.00003$ (U. S. Int. volt 1948, $pq = 1.00033$)
E	International joule ($= pq^2$ abs-joule)	pq^2	$= 1.00020 \pm 0.00004_5$ (U. S. Int. joule 1948, $pq^2 = 1.000165$)
G	Specific gravity of Hg (0°C, A_0) referred to air-free water at maximum density	ρ_0	$= 13.59542 \pm 0.00005$
G	Density of Hg (0°C, A_0)	D_0	$= 13.59504_0 \pm 0.00005_7\ \mathrm{g} \cdot \mathrm{cm}^{-3}$
J	Electrochemical equivalents (chemical scale)		
	silver (apparent)	E_{Ag}	$= 1.11800 \times 10^{-3}\ \mathrm{g} \cdot \mathrm{int\text{-}coul}^{-1}$
	(corrected)	E_{Ag}	$= (1.11807 \pm 0.00012) \times 10^{-3}\ \mathrm{g} \cdot \mathrm{abs\text{-}coul}^{-1}$
	iodine (apparent)	E_{I}	$= (1.315026 \pm 0.000025) \times 10^{-3}\ \mathrm{g} \cdot \mathrm{int\text{-}coul}^{-1}$
	(corrected)	E_{I}	$= (1.31535 \pm 0.00014) \times 10^{-3}\ \mathrm{g} \cdot \mathrm{abs\text{-}coul}^{-1}$
K	Effective calcite grating space (18°C), Siegbahn system	d_{18}''	$= 3.02904 \times 10^{-8}\ \mathrm{cm}$
K	True calcite grating space (20°C), Siegbahn system	d_{20}'	$= 3.02951_2 \times 10^{-8}\ \mathrm{cm}$
K	True calcite grating space (20°C), c.g.s. system	d_{20}	$= (3.03567_4 \pm 0.00018) \times 10^{-8}\ \mathrm{cm}$
K	Ratio of grating and Siegbahn scales of wave-lengths	λ_g/λ_s	$= 1.002034 \pm 0.000060$
K	Density of calcite (20°C)	ρ	$= 2.71029 \pm 0.00003\ \mathrm{g} \cdot \mathrm{cm}^{-3}$
K	Structural constant of calcite (20°C)	ϕ	$= 1.09594 \pm 0.00001$
K	Molecular weight of calcite (chemical scale)	M	$= 100.091_4 \pm 0.005$
L	Rydberg constant for hydrogen ($\mathrm{H^1}$)	R_{H}	$= 109677.581_2 \pm 0.007_5\ \mathrm{cm}^{-1}$ (I.A. scale)
L	Rydberg constant for deuterium ($\mathrm{H^2}$)	R_{D}	$= 109707.419_3 \pm 0.007_5\ \mathrm{cm}^{-1}$ (I.A. scale)
L	Rydberg constant for helium	R_{He}	$= 109722.263 \pm 0.012\ \mathrm{cm}^{-1}$ (I.A. scale)
L	Rydberg constant for infinite mass	R_∞	$= 109737.303 \pm 0.017\ \mathrm{cm}^{-1}$ (I.A. scale) or $\pm\ 0.05\ \mathrm{cm}^{-1}$ (c.g.s. system)

VALUES OF THE GENERAL PHYSICAL CONSTANTS (Continued)

Table C. Partial List of Derived Quantities*

Planck constant

$$h = \left\{\frac{2\pi^2c^3F^5}{R_\infty N_0{}^5(e/m)}\right\}^{1/3} = (6.624_2 \pm 0.002_4) \times 10^{-27}\ \text{erg} \cdot \text{sec}$$

$$h/e = \left\{\frac{2\pi^2c^3F^2}{R_\infty N_0{}^2(e/m)}\right\}^{1/3} = (4.1349_0 \pm 0.0007_1) \times 10^{-7}\ \text{erg} \cdot \text{sec} \cdot \text{e.m.u.}^{-1}$$

$$h/e' = h/ec = \left\{\frac{2\pi^2F^2}{R_\infty N_0{}^2(e/m)}\right\}^{1/3} = (1.3793_3 \pm 0.0002_3) \times 10^{-17}\ \text{erg} \cdot \text{sec} \cdot \text{e.s.u.}^{-1}$$

Atomic weight of electron

$$E = F/(e/m)$$

$$\text{(physical scale)} = (5.4862_4 \pm 0.0017) \times 10^{-4}$$

$$\text{(chemical scale)} = (5.4847_5 \pm 0.0017) \times 10^{-4}$$

Band spectra constant connecting wave number and moment of inertia

$$h/8\pi^2c = \left\{\frac{F^5}{256\pi^4R_\infty N_0{}^5(e/m)}\right\}^{1/3} = (27.98_{65} \pm 0.01_0) \times 10^{-40}\ \text{g} \cdot \text{cm}$$

Boltzmann constant

$$k = R_0/N_0 = V_0A_0/T_0N_0 = (1.38047_4 \pm 0.00026) \times 10^{-16}\ \text{erg} \cdot \text{deg}^{-1}$$

Charge in electrolysis of one gram of H

$$F/H = 9572.1_{73} \pm 1.0\ \text{abs. e.m.u.} \cdot \text{g}^{-1}$$

Charge in electrolysis of one gram of H^1

$$e/M_{H^1} = F/H^1 = 9573.5_{60} \pm 1.0\ \text{abs e.m.u. g}^{-1}$$

Compton shift at 90°

$$h/mc = \left\{\frac{2\pi^2F^2(e/m)^2}{R_\infty N_0{}^2}\right\}^{1/3} = (0.024265_{14} \pm 0.000005_7) \times 10^{-8}\ \text{cm}$$

Energy in ergs of one abs-volt-electron

$$E_0 = 10^8e = 10^8F/N_0 = (1.60203_3 \pm 0.00034) \times 10^{-12}\ \text{erg}$$

Energy in calories per mole for one abs-volt-electron per molecule

$$\frac{F\ \text{(abs. coul. per gram equiv)}}{J_{15}\ \text{(abs. joules per cal)}} = 23052._{85} \pm 3._2\ \text{cal}_{15} \cdot \text{mole}^{-1}$$

VALUES OF THE GENERAL PHYSICAL CONSTANTS (Continued)

Fine structure constant.........$\alpha = 2\pi(e')^2/hc = \left\{\frac{4\pi R_\infty F(e/m)}{N_0}\right\}^{1/3} = (7.2976_6 \pm 0.0008_6) \times 10^{-3}$

$$1/\alpha = 137.030_2 \pm 0.016$$

$$\alpha^2 = (5.3256 \pm 0.0013) \times 10^{-5}$$

Gas constant per mole........$R_0 = V_0A_0/T_0 = (8.31436 \pm 0.00038) \times 10^7$ erg · deg^{-1} · mole^{-1}

$R_0' = R_0 \cdot 10^{-7}/J_{15} = 1.98646_7 \pm 0.00021$ cal$_{15}$ · deg^{-1} · mole^{-1}

$R_0'' = V_0'/T_0 = (8.20544_7 \pm 0.00037) \times 10^{-2}$ liter · atmos · deg^{-1} · mole^{-1}

$R_0''' = R_0/A_0 = V_0/T_0 = 82.0566_7 \pm 0.0037$ cm^3 · atmos · deg^{-1} · mole^{-1}

also $R_0T_0 = V_0A_0 = (2.27115_0 \pm 0.00006) \times 10^{10}$ erg · mole^{-1}

Loschmidt number (0°C, A_0).. $n_0 = N_0/V_0 = (2.6870_{12} \pm 0.0005_0) \times 10^{19}$ atmos^{-1} cm^{-3}

Magnetic moment of one Bohr magneton....$\mu_1 = (h/4\pi)(e/m) = \frac{1}{4\pi}\left\{\frac{2\pi^2c^3F^5(e/m)^2}{R_\infty N_0^5}\right\}^{1/3}$

$= (0.9273_{45} \pm 0.0003_7) \times 10^{-20}$ erg · gauss^{-1}

Magnetic moment per mole for one Bohr magneton per molecule

$$\mu_1N_0 = \frac{1}{4\pi}\left\{\frac{2\pi^2c^3F^5(e/m)^2}{R_\infty N_0^2}\right\}^{1/3} = 5585.2_4 \pm 1.6 \text{ erg} \cdot \text{gauss}^{-1} \cdot \text{mole}^{-1}$$

Mass of α-particle....................$M_\alpha = (\text{He} - 2E)/N_0 = (6.6442_2 \pm 0.0012) \times 10^{-24}$ g

Mass of atom of unit atomic weight.............$M_0 = 1/N_0 = (1.66035 \pm 0.00031) \times 10^{-24}$ g

Mass of electron.................$m = e/(e/m) = (F/N_0)/(e/m) = (9.1066_0 \pm 0.0032) \times 10^{-28}$ g

Mass of H¹ atom..............$M_{H^1} = H^1/N_0 = (1.67339_3 \pm 0.00031) \times 10^{-24}$ g

Mass of proton.................$M_p = (H^1 - E)/N_0 = (1.67248_2 \pm 0.00031) \times 10^{-24}$ g

Radiation density constant....................$a = 8\pi^5k^4/15c^3h^3 = \left(\frac{V_0A_0}{T_0}\right)^4 \frac{4\pi^3N_0R_\infty(e/m)}{15c^6F^5}$

$= (7.569_{42} \pm 0.0049) \times 10^{-15}$ erg · cm^{-3} · deg^{-4}

Ratio mass H¹ atom to mass electron......$M_{H^1}/m = (e/m)(H^1/F) = 1837.5_{61} \pm 0.5_6$

Ratio mass proton to mass electron.......$M_p/m = (e/m)\left(\frac{H^1 - E}{F}\right) = 1836.5_{61} \pm 0.5_6$

Second radiation constant......$c_2 = hc/k = \frac{c^2T_0}{V_0A_0}\left\{\frac{2\pi^2F^5}{R_\infty N_0^2(e/m)}\right\}^{1/3} = 1.4384_8 \pm 0.0003_4$ cm · deg

VALUES OF THE GENERAL PHYSICAL CONSTANTS (Continued)

Specific charge of α-particle. . . . . $2e/M_\alpha = \dfrac{2F}{\text{He} - 2E} = 4822.3_3 \pm 0.5_1$ abs. e.m.u. · g^{-1}

Specific charge of proton. . . . . $e/M_p = \dfrac{F}{H^1 - E} = 9578.7_7 \pm 1.0$ abs. e.m.u. · g^{-1}

Wave-lengtn associated with one abs-volt†

$$\lambda_0 = 10^{-8}c^2(h/e') = \frac{c^2}{10^8}\left\{\frac{2\pi^2F^2}{R_\infty N_0{}^2(e/m)}\right\}^{1/3} = (12395._4 \pm 2._1) \times 10^{-8} \text{ cm} \cdot \text{abs-volt}$$

Wave number associated with one abs-volt

$$s_0 = 1/\lambda_0 = \frac{10^8}{c^2}\left\{\frac{R_\infty N_0{}^2(e/m)}{2\pi^2F^2}\right\}^{1/3} = 8067.4_9 \pm 1.4 \text{ cm}^{-1} \cdot \text{abs-volt}^{-1}$$

Wien's displacement law constant‡ . . . . . . $A = c_2/4.965114 = 0.28971_8 \pm 0.00007$ cm · deg

Zeeman displacement per gauss. . . . . . . $(e/m)/4\pi c = (4.6699_1 \pm 0.0013) \times 10^{-5}$ $\text{cm}^{-1} \cdot \text{gauss}^{-1}$

---

* In order to be able to calculate, by propagation of errors, the probable error in a derived quantity, it is necessary to express the quantity explicitly in terms of the various fundamental quantities of Table A, or of Table B, and that has been done in each case. Since in this paper *e* and *h* are treated as derived quantities, they do not therefore appear in such explicit expressions. But in calculating *numerical* values of derived quantities, the work can often be greatly simplified by using the values of other previously calculated derived quantities—in particular *e* and *h*. In order to show how certain derived quantities depend on quantities like *e* and *h*, such alternative expressions are given in many cases.

† The factor 10^{-8} was accidentally omitted, in G.C. 1929, in the equation for λ_0.

‡ The factor 4.965114 is the root of $e^{-\beta} + (\beta/5) - 1 = 0$

ATOMIC CONSTANTS

From: A Survey of Atomic Constants (1955) by J. A. Bearden and John H. Thomsen, The John Hopkins University

N	Avogadro's number	$(6.0247 \pm .0002) \times 10^{23}$ mol^{-1} (physical scale)

e/mc	Specific charge of the electron	$(1.75888 \pm .00003) \times 10^{7}$ esu gm^{-1} sec cm^{-1}
h/m		$(7.27378 \pm .00005)$ cm^2 sec^{-1}
$\lambda_{ce} = h/mc$	Compton wavelength of the electron	$(2.42627 \pm .00002) \times 10^{-10}$ cm
Nm	Atomic weight of the electron	$(5.48760 \pm .00004) \times 10^{-4}$ amu
$a_0 = h^2/4\pi^2me^2$	First Bohr radius	$(5.29173 \pm .00002) \times 10^{-9}$ cm
$r_0 = e^2/mc^2$	Classical radius of the electron	$(2.81751 \pm .00006) \times 10^{-13}$ cm
H	Atomic weight of hydrogen	$(1.0081445 \pm .0000010)$ amu
$H^+ = H - Nm$	Atomic weight of proton	$(1.0075957 \pm .0000010)$ amu
H^+/Nm	Ratio proton mass to electron mass	$1836.13 \pm .02$
$\mu = mH^+/H$	Reduced mass of electron in the hydrogen atom	$(9.1036 \pm .0003) \times 10^{-28}$ gm
$\sigma = 2\pi^5R_0^4/15c^2h^3N^4$	Stefan Boltzmann constant	$(5.6696 \pm .0004) \times 10^{-5}$ erg cm^{-2} sec^{-1} (°K)$^{-4}$
$k = R_0N^{-1}$	Boltzmann constant	$(1.38049 \pm .00005) \times 10^{-16}$ erg (°K)$^{-1}$
$c_1 = 8\pi hc$	First radiation constant	$(4.9920 \pm .0002) \times 10^{-15}$ erg cm
$c_2 = hcNR_0^{-1}$	Second radiation constant	$(1.43879 \pm .00003)$ cm (°K)
$h/k = c_2/c$	Atomic specific heat constant	$(4.79894 \pm .00021) \times 10^{-11}$ sec deg
$(3k/N)^{\frac{1}{2}} = (3R_0/N^2)^{\frac{1}{2}}$	Multiplier of (Curie const.)$^{\frac{1}{2}}$	$(2.62148 \pm .00007) \times 10^{-20}$ (erg mol deg^{-1})$^{\frac{1}{2}}$ (physical scale)
λ_g/λ_s	Conversion factor from Siegbahn x-units to milliangstroms	$1.00203 \pm .00002$
R_∞	Rydberg for infinite mass	$109737.31 \pm .01$ cm^{-1}
$R_H = (1 - Nm/H)R_\infty$	Rydberg for hydrogen	$109677.57_6 \pm .01$ cm^{-1}
$\lambda_{\max} \mathrm{T} = chN/(4.965114R_0) = .2014052c_2$	Wien displacement constant	$(.289780 \pm .000005)$ cm (°K)
$\lambda_{cp} = \lambda_{ce}Nm/H^+$	Compton wavelength of the proton	$(1.32140 \pm .00002) \times 10^{-13}$ cm
$\lambda_0 = (hc^2/e)10^{-8}$	Wavelength associated with 1 ev.	$(1.23978 \pm .00002) \times 10^{-4}$ cm
$\nu_0 = 10^8(e/hc^2)$	Wave number associated with 1 ev.	$(8.0659 \pm .0001) \times 10^3$
$10^8e/c$	Energy associated with 1 ev.	$(1.60209 \pm .00001) \times 10^{-12}$ erg
$(F'/R_0)10^8$	"Temperature" associated with 1 ev.	$(1.16052 \pm .00001) \times 10^4$ °K

ATOMIC CONSTANTS (Continued)

$n_0 = N/V_0$	Loschmidt's number	$(2.68709 \pm .00009 \times 10^{19}$ cm^{-3}
$E_0 = (c^2/F')10^{-14}$	Conversion factor atomic mass units to Mev	$(9.3116 \pm .0001) \times 10^2$
$Eg = (c^2/e')10^{-14}$	Conversion factor from grams to Mev	$(5.6099 \pm .0001) \times 10^{26}$ mev gm^{-1}
$\mu_1 = he/4\pi m$	Bohr magneton	$(.92733_4 \pm .00002) \times 10^{-20}$ erg oer^{-1}
mc^2	Energy equivalent of *e* mass in mev	$(.510969 \pm .000010)$ mev (emass)$^{-1}$
$E_p = E_e H^+/Nm$	Energy equivalent of proton mass in mev.	$(938.210 \pm .008)$ mev (proton)$^{-1}$
S_0/R_0	Sakur Tetrode constant	$(-5.57305 \pm .00007)$
S_0		$(-4.634907 \pm .000036) \times 10^8$ erg mol^{-1} deg^{-1} (physical scale)
$\pi ce/4m$	Zeeman displacement per gauss	$(4.6703 \pm .0005) \times 10^{-5}$ cm^{-1} gauss^{-1}*
$a_0' = a_0(1 - \alpha^2)^{\frac{1}{2}}$	Separation of electron and proton in the ground state of H^1	$(.529196 \pm .000028) \times 10^{-8}$ cm*
$a_0'' = a_0' R_\infty / R_H$	Radius of the electron orbit, referred to center of mass for normal H^1	$(5.29484 \pm .000028) \times 10^{-8}$ cm*
$R_H \alpha^2/16$	Doublet separation in hydrogen	$(.365076 \pm .000038)$ cm^{-1}*
$\nu_0 = 10^8 e/hc$	Frequency associated with one ev	$(2.41856 \pm .00017) \times 10^{14}$ sec^{-1}*
$v_0 = [2 \cdot 10^8(e/m)]^{\frac{1}{2}}$	Speed of 1 ev electron	$(5.93188 \pm 0.00030) \times 10^7$ cm sec^{-1}*

* Cohen and DuMond, Review of Modern Physics, **21**: 651, 1949.

THE PARTICLES OF PHYSICS

Mass in units of 9.1085×10^{-28} g.	Generic name	Name	Sym-bol	Charge in units of 4.80×10^{-10} esu	Magnetic moment	Spin	Parity	Lifetime in free space (sec.)	Decay scheme	Energy release mev

SYMBOLS FOR FUNDAMENTAL PARTICLES

Symbols Proposed at Bagnères Congress

The following proposal for a new set of symbols for fundamental particles was agreed upon as a result of discussions held during the International Cosmic-Ray Congress at Bagnères de Bigorre in the French Pyrenees, July 6–12, 1953. The Congress was organized by the University of Toulouse with the support of Unesco and of the Commission for Cosmic Rays of IUPAP.

CLASSIFICATION OF PARTICLES

A. *Groups of Particles*

Light mesons (L-mesons):

π-mesons, μ-mesons, any other lighter meson which may be discovered.

Heavy mesons (K-mesons):

all particles heavier than π-mesons and lighter than protons.

Hyperons (Y-particles):

all particles with mass intermediate between that of the neutron and the deuteron (this definition might be revised if fundamental particles heavier than deuterons are discovered).

B. *"Christian Names"*

Use capital Greek letters for hyperons and small Greek letters for mesons.

(1) *Hyperons*

Λ^0: particle previously known as $V_1{}^0$ and characterized by the decay scheme $\Lambda^0 \to p + \pi^-$. If it turns out (as suggested by some results) that there are particles with this decay scheme and different Q-values, they could be designated by different subscripts.

Λ^+: the positive counterpart of Λ^0 with the possible decay schemes:

$$\Lambda^+ \to n + \pi^+$$
$$\Lambda^+ \to p + \pi^0$$

The existence of these particles is indicated by recent experiments.

(2) *Heavy Mesons*

$\tau \to 3\pi$ (considered certain).

$\kappa \to \mu + 2$ *neutral particles* (considered very probable; however, the nature of the neutral products is still unknown).

$\chi \to \pi + 1$ *neutral particle* (considered as probable; nature of neutral particle unknown).

SYMBOLS FOR FUNDAMENTAL PARTICLES (Continued)

θ^0: particle previously known as v^0, $V_2{}^0$, $V_4{}^0$, characterized by the decay scheme $\theta^0 \rightarrow \pi^\pm + (\pi^\pm \text{ or } \mu^\mp)$. If it turns out (as suggested by some results) that there are particles with this decay scheme and several Q-values, they could be designated by different subscripts.

V-event:

phenomenon which can be interpreted as the decay in flight of K-meson or Y-particle. Subdivisions: V^0-event; decay of a neutral particle; $V^\pm$-event, decay of a charged particle.

S-event:

phenomenon which can be interpreted as the decay at rest of a charged K-particle or Y-particle.

ABBREVIATIONS AND SYMBOLS

Abbreviations

The following list of abbreviations is intended to cover those in common use in chemistry and physics. Symbols are presented in a separate list following the abbreviations.

A.	Acre
Å	Ångström unit
a	Are
a.	Acid
abs.	Absolute
abt.	About
a.c.	Alternating current
acet.	Acetone
acet. a.	Acetic acid
al.	Alcohol
alk.	Alkali
alt.	Altitude
amal.	Amalgam; amalgamated
amor. *or* amorph.	Amorphous
amp.	Ampere
anh.	Anhydrous
antilog	Antilogarithm
ap.	Apothecaries'
appr.	Approximately
aq.	Aqua; aqueous; water
aq. reg.	Aqua regia
asym.	Asymmetrical
atm. *or* atmos.	Atmosphere (atmospheric)
At. No.	Atomic number
At. Wt.	Atomic weight
aux.	Auxiliary
Av.	Average
av. *or* avoir.	Avoirdupois
bar.	Barometer
bbl.	Barrel
bd.	Board
Bé	Beaumé (degrees)
B.G.	Birmingham gauge (hoop and sheet)
b.h.p.	Brake horse power
bl.	Blue
blk.	Black
B.M.	Board measure
b.p.	Boiling point
br.	Brown
BTU	British thermal unit
bu.	Bushel
B.W.G.	Birmingham wire gauge
bz.	Benzene
C	Centigrade
c	Carat; centi-
c.	Cold
ca	Candle
ca.	*Circa*, about; approximately
cal.	Calorie (gram)
cc. *or* c.c.	Cubic centimeter
cd.	Cord
c. cm	Cubic centimeter
Cent.	Centigrade
centi-	Prefix meaning 1/100
cf.	*Confer*, compare
c.f.m.	Cubic foot per minute
cgs	Centimeter-gram-second system of units
cgse	Cgs electrostatic system
cgsm	Cgs electromagnetic system
ch.	Chain
chl.	Chloroform
cir.	Circular
circum.	Cirumference
cl	Centiliter
cm	Centimeter
cm^2	Square centimeter
cm^3	Cubic centimeter
c.m.	Circular mil
coef.	Coefficient
colog	Cologarithm
colorl.	Colorless
comm'l	Commercial
conc.	Concentrated
cond.	Condensing
const.	Constant
cos	Cosine
$\cos^{-1}$	Arc or angle whose cosine is...; anticosine of; inverse cosine of
cosec	Cosecant
cosh	Hyperbolic cosine
$\cosh^{-1}$	Inverse hyperbolic cosine
cot	Cotangent
$\cot^{-1}$	Arc or angle whose cotangent is . . .
coth	Hyperbolic cotangent
$\coth^{-1}$	Inverse hyperbolic cotangent
covers	Coversed sine
c.p.	Candle power; circular pitch; center of pressure
cry. *or* cryst.	Crystalline; crystals
csc	Cosecant
$\csc^{-1}$	Arc or angle whose cosecant is...
csch	Hyperbolic cosecant
csch^{-1}	Inverse hyperbolic cosecant
CTU	Centigrade thermal unit
cu.	Cubic
cu. cm	Cubic centimeter
cu. ft.	Cubic foot
cu. in.	Cubic inch
cu. m	Cubic meter
cu. yd.	Cubic yard
cwt.	Hundredweight
cyl.	Cylinder
d	Derivative; deci-
d.	Decomposes; day
d.	Dextrorotary
d.c.	Direct current
dec.	Decomposes
deci-	Prefix meaning 1/10
def.	Definition (s)
deg	Thermometric degree; absolute C unless contrary is indicated
deka-	Prefix meaning 10
deliq.	Deliquescent
den. *or* dens.	Density
dg	Decigram
diam.	Diameter
dil.	Dilute
dissd.	Dissolved
dk	Deka-
dk.	Dark
dkg.	Dekagram
dkl	Dekaliter
dkm	Dekameter
dkm^2	Square dekameter
dkm^3	Cubic dekameter
dks	Dekastere
dl	Deciliter

ABBREVIATIONS AND SYMBOLS (Continued)

Abbreviations (Continued)

dm	Decimeter
dm^2	Square decimeter
dm^3	Cubic decimeter
d.p.	Diametral pitch; double pole
dr.	Dram
dr. ap. *or* ʒ ap.	Dram, apothecaries'
dr. av. *or* ʒ av.	Dram, avoirdupois
dr. fl. *or* ʒ fl.	Dram, fluid
dr. t. *or* ʒt.	Dram, troy
ds	Decistere
dwt.	Pennyweight
efflor.	Efflorescent
e.g.	*Exempli gratia*, for example
e.h.p.	Effective horse power
E.L.	Elastic limit
em	Cgsm unit of quantity of electricity
emf *or* e.m.f.	Electromotive force
es	Electrostatic or cgse unit of quantity of electricity
etc.	*Et. cetera*, and so forth
eth.	Ether
eth. acet.	Ethyl acetate
et. seq.	*Et sequentes*, and the following
evap.	Evaporation
ex.	Excess
exp	Exponential function
exp.	Explodes
exsec	Exterior secant
F	Fahrenheit
f.	From
fahr.	Fahrenheit
fath.	Fathom
feath.	Feathery
f.h.p.	Friction horse power
fir.	Firkin
fl.	Fluid
fl. dr.	Dram, fluid
fl. oz.	Ounce, fluid
fluores.	Fluorescent
fps	Foot-pound-second system of units
fpse	Foot-pound-second electrostatic system
fpsm	Foot-pound-second electromagnetic system
F.S.	Factor of safety
ft.	Foot
ft.^{2}	Square foot
ft.^{3}	Cubic foot
ft.-lb.	Foot-pound
fur.	Furlong
G	Gravitation constant
g	Gram
g-cal. *or* g.-cal.	Gram calorie
gal.	Gallon
gel.	Gelatinous
gi.	Gill
glac.	Glacial
glit.	Glittering
glyc.	Glycerine
gm.	Gram
gr.	Gray; grain
grn.	Green
gyr.	Gyration
h	Hecto-
h.	Hot; hour
ha	Hectare
hecto-	Prefix meaning 100
hex.	Hexagonal
hg	Hectogram
hhd.	Hogshead
hl	Hectoliter
hm	Hectometer
hm^2	Square hectometer
hm^3	Cubic hectometer
hor. *or* horiz.	Horizontal
h.-p.	High-Pressure
HP *or* h.p.	Horse power
h.p.-hr.	Horse power-hour
hr.	Hour
hyg.	Hygroscopic
i.	Insoluble
ibid.	*Ibidem*, in the same place
i.e.	*Id est*, that is
ign.	Ignites
i.h.p.	Indicated horse power
in.	Indigo; inch
in.^{2}	Square inch
in.^{3}	Cubic inch
inc.	Inclusive
in.-lb.	Inch-pound
insol.	Insoluble
Int.	International
iso.	Isotropic
isom.	Isometric
isoth.	Isothermal
k	Kilo-
kg	Kilogram
kg-cal.	Kilogram-calorie
kg-m	Kilogram-meter
kilo-	Prefix meaning 1,000
kl	Kiloliter
km	Kilometer
km^2	Square kilometer
km^3	Cubic kilometer
kva.	Kilovolt-ampere
kw.	Kilowatt
kw.-hr.	Kilowatt-hour
l	Liter
l.	Long
l	Laevorotary
lat.	Latitude
lb.	Pound
lb. ap.	Pound, apothecaries'
lb. av.	Pound, avoirdupois
lb. t.	Pound, troy
leaf.	Leaflets
lgr.	Ligroin
li.	Link
lin.	Linear
liq.	Liquid
lim.	Limit
ln	Natural hyperbolic or Napierian logarithm
log *or* log.	Logarithm
log$_e$	Logarithm to the base *e*; natural, hyperbolic or Napierian logarithm
log$_{10}$	Common logarithm; logarithm to the base 10
long.	Longitude
lng.	Long
l.-p.	Low-pressure
lt.	Light
lust.	Lustrous
♏	Minim or drop
m	Meter; milli-
m^2	Square meter
m^3	Cubic meter
m.	Minute
m.	Meta-
max.	Maximum
med.	Medium
meth.	Methyl
meth. al.	Methyl alcohol
m.e.p.	Mean effective pressure
met.	Metallic
mg	Milligram

ABBREVIATIONS AND SYMBOLS (Continued)

Abbreviations (Continued)

m.h.c.p.	Mean horizontal candle power
mi.	Mile
mic.	Microscopic
micro-	Prefix meaning 1/1,000,000 or 10^{-6}
micro-micro	Prefix meaning 10^{-12}
milli-	Prefix meaning 1/1,000
milli-micro-	Prefix meaning 10^{-9}
min *or* min.	Minute
min.	Minim; minimum; mineral
ml	Milliliter
m.l.h.c.p.	Mean lower hemispherical candle power
mm	Millimeter
mm^2	Square millimeter
mm^3	Cubic millimeter
mmf *or* m.m.f.	Magnetomotive force
mol.	Molecule
Mol. Wt.	Molecular weight
monocl.	Monoclinic
m.p.	Melting point
m.s.c.p.	Mean spherical candle power
myria-	Prefix meaning 10,000 or 10^4
mμ	Millimicron; millimicro-
N	Numeric; number (in mathematical tables)
n.	Normal
n	Refractive index
need.	Needles
o	Ortho-
Obs.	Observer
octahdr.	Octahedral
oil turp.	Oil of turpentine
or.	Orange
oz.	Ounce
oz. ap. *or* ℥ ap.	Ounce, apothecaries'
oz. av. *or* ℥ av.	Ounce, avoirdupois
oz. fl. *or* ℥ fl.	Ounce, fluid
oz. t. *or* ℥ t.	Ounce, troy
p	Para-
pa.	Pale
p. ct.	Per cent
perp.	Perpendicular
p.f.	Power factor
pk.	Peck
pl.	Plates
powd.	Powder
pr.	Prisms
precip. *or* p'p't'd	Precipitated
p. sol.	Partly soluble
pt.	Point; pint
purp.	Purple
pyr.	Pyridine
Q	Quantity
q	Quintal
qt.	Quart
q.v.	*Quod vide,* which see
R	Réaumur; radioactive mineral
rac	Racemic
rad	Radian, measure of angle
rad.	Radius
rd.	Rod
reg.	Regular
rev.	Revolution
rhbdr.	Rhombohedral
rhomb.	Rhombic or orthorhombic
R.M.S.	Square root of mean square
r.p.m.	Revolutions per minute
s	Stere
s.	Scruple; soluble; second
s. ap. *or* ℈	Scruple, apothecaries'
sat. *or* sat'd	Saturated
sc.	Scales
S.E.	Siemens unit
sec *or* sec.	Second (mean solar unless contrary is stated)
sec	Secant
sec^{-1}	Arc or angle whose secant is . . .
sech	Hyperbolic secant
sech^{-1}	Inverse hyperbolic secant
segm.	Segment
sh.	Short
sin	Sine
sin^{-1}	Arc or angle whose sine is . . .
sinh	Hyperbolic sine
sinh^{-1}	Inverse hyperbolic sine
sl.	Slightly
sm.	Small
sol.	Solution; soluble
soln.	Solution
sp.	Specific
specif.	Specification
sp. gr.	Specific gravity
sq.	Square
sq. ch.	Square chain
sq. ft.	Square foot
sq. in.	Square inch
sq. mi.	Square mile
sq. rd.	Square rod
sq. yd.	Square yard
std.	Standard
subl.	Sublimes
sym.	Symmetrical
t	Metric ton
t.	Troy
tab. *or* tabl.	Tablets
tan	Tangent
tan^{-1}	Arc or angle whose tangent is . . .
tanh	Hyperbolic tangent
tanh^{-1}	Inverse hyperbolic tangent
temp.	Temperature
tetr. *or* tetrag.	Tetragonal
tn.	Ton
tr.	Transition
tricl.	Triclinic
trig.	Trigonal
trim.	Trimetric
T.S.	Tensile strength
turp.	Turpentine
Tw.°	Degrees Twaddell, hydrometer scale
ult.	Ultimate
uns.	Unsymmetrical
U.S.	United States of America; universal system of lens apertures
v.	Very
v.	*Vide,* see
vel. *or* veloc.	Velocity
vers	Versed sine
vert	Vertical
visc.	Viscous
vol.	Volume
volt.	Volatilizes
w.	Water
wh.	White
wt.	Weight
yd.	Yard
yel.	Yellow
yr.	Year
μ	Micron; micro-
$\mu\mu$	Micromicron; micromicro-

Symbols

The following list of symbols is arranged from the Final Report of the Committee on Letter Symbols and Abbreviations of the American Association of Physics Teachers, H. K. Hughes, Chairman, published in the American Journal of Physics, Vol. 16, No. 3, 164–179, March, 1948.

Definitions in parentheses are those whose use is discouraged by the committee.

English Letter Symbols

$\mathbf{A}$	Magnetic vector potential.
A	Area; amplitude; atomic weight; refracting angle of prism; strength of simple acoustic source; power gain of amplifier; power amplification of amplifier; voltage gain of amplifier; voltage amplification of amplifier; Helmholtz function or maximum isothermal work function: per mole, per total value $[= U - TS]$; Richardson equation factors $[I_s = AT^2e^{-b/T}]$.
A_M	Helmholtz function or maximum isothermal work function per mole.
A_p	Power amplification of amplifier; power gain of amplifier.
A_v	Voltage amplification of amplifier; voltage gain of amplifier.
A, B, C	Cauchy constants $[n = A + B/\lambda^2 + C/\lambda^4]$.
$\mathbf{a}$	Linear acceleration.
a	Activity (chem.); aperture (optics); coefficient of accommodation; slit width (transparent portion); radius of tube, disk or membrane (acoust.); mean absorption coefficient for a room (acoust.); Helmholtz function or maximum isothermal work function: per atom or molecule, per mole, per unit mass; Van der Waals constants, $\left[\left(p + \frac{n^2a}{V^2}\right)(V - nb) = nRT\right]$.
a_m	Helmholtz function or maximum isothermal work function per atom or molecule.
a_1	Bohr radius $[= h^2/4\pi^2me^2]$.
$_a$ (subscript)	Adsorbed.
$_{av}$ (subscript)	Average value; or use bar over symbol (e.g., I_{av}, $\bar{I}$)
$\mathbf{B}$	Magnetic flux density or magnetic induction density.
B	Susceptance; brightness or luminance $[= dI/dA \cos\theta]$; volume modulus of elasticity (reciprocal of compressibility factor).

$\mathcal{B}$	Steradiancy [$= dJ/dA \cos\theta$].
b	Susceptance; breadth or width; closest possible distance of approach (in Rutherford scattering formula); radiation law constants (Wien); Wien displacement constant [$= \lambda_m T$]; Richardson equation factors [$I_s = AT^2 e^{-b/T}$]; Van der Waals constants $\left[\left(p + \frac{n^2a}{V^2}\right)(V - nb) = nRT\right]$
$_b$ (subscript)	Black body.
C	Compliance; normality; capacitance or permittance; heat capacity: per mole, total value (use subscripts p or V to indicate constancy of pressure or of volume); (speed or velocity rms.).
C_M	Heat capacity per mole.
$\mathbf{c}_0$	(Most probable velocity).
c	Speed of light in vacuum, speed of sound; velocity of light in vacuum; velocity of sound or other waves; induction coefficient, or partial capacitance coefficient; heat capacity: per atom or molecule, per mole, per unit mass (specific); concentration (*solutions*), or use bracket [ ] notation; distance from neutral axis to extreme fibre (*beams*); (acoustic conductivity of an opening).
c (with suitable subscript)	Partial capacitance.
c_m	Heat capacity per atom or molecule.
c_0	(Most probable speed).
c_1, or c_2	Planck radiation law constants $\left[\frac{J_\lambda}{A \cos\theta} = N_\lambda = \frac{c_1}{\lambda^5}\left(\exp\frac{c_2}{\lambda T} - 1\right)\right]$
$_c$ (subscript)	Cathode; critical properties.
$\mathbf{D}$	Electric displacement; displacement flux density; electric (dielectric) flux density [$\Psi = \int \mathbf{D} \cdot d\mathbf{A}$]; electric induction density.
$\dot{\mathbf{D}}$	Displacement current.
$\dot{\mathbf{D}}/4\pi$	Displacement current.
D	Diameter; optical density [$= \log_{10} P_0/P$]; optical attenuation; angle of minimum deviation; angular dispersion [$= d\theta/d\lambda$]; coefficient of diffusion (fluid); dioptric power [$= n/f$]; power of lens system, or refracting power [$= n/f$, diopters]; (density [$= m/V$]); (mass per unit volume (density)).

ABBREVIATIONS AND SYMBOLS (Continued)
English Letter Symbols (Continued)

d	Distance between corresponding points of grating (grating space); distance between lens units in an optical system; interplanar distance (Bragg law); spacing of Bragg planes in a crystal.
$\mathbf{E}$	Electric field strength.
E	Total energy; illuminance, or amount of illumination $[= \mathrm{d}F/\mathrm{d}A]$; Young modulus of elasticity; (electromotive force, or e.m.f.).
E_k	Kinetic energy.
E_p	Potential energy.
E_v	Energy of vibration.
$\mathcal{E}$	Irradiance or radiant flux density $[= \mathrm{d}\Phi/\mathrm{d}A$ or $\mathrm{d}P/\mathrm{d}A]$; electromotive force, or e.m.f.
e	Base of natural (Naperian) logarithms $[= 2.718 \ldots]$; coefficient of resiliance or coefficient of restitution.
$-e$	Electronic charge.
F	Formality; weight $[= mg]$; force; gravitational force; force in a string or membrane; force, stretching ("tension") in a string or membrane; luminous flux; distribution function; hyperfine quantum number $[= I + J]$; Faraday constant or equivalent.
F_g	Gravitational force.
$\mathfrak{F}$	Magnetomotive force, or magnetic scalar potential.
f	Fugacity; distribution function; relative humidity; frequency (elect. circuits, mechanics, acoust.); focal length of object space; degrees of freedom (kinetic theory; Gibb's phase rule); coefficient of friction (use if μ designates the Poisson ratio).
f_r	Natural or resonant frequency.
f_0	(Photoelectric threshold frequency).
f'	Focal length of image space.
$_f$ (subscript)	Filament.
G	Electric conductance; Gibbs function: per mole $[= G/n]$, total value $[= H - TS]$; gravitational constant, Newtonian; rigidity or shear modulus of elasticity.
G_M	Gibbs function per mole $[= G/n]$.
g	Electric conductance; gravitational acceleration; gyromagnetic ratio; statistical weight or degeneracy; Gibbs function: per atom or molecule, per mole $[= G/n]$, per unit mass; Landé factor.

ABBREVIATIONS AND SYMBOLS (Continued)
English Letter Symbols (Continued)

$-g$	Acceleration of free fall.
g_g	Grid or input conductance.
g_L	Gravitational acceleration, local value.
g_m	Gibbs function per atom or molecule; (grid-plate transconductance, real part of grid-plate transadmittance).
g_o	Gravitational acceleration, standard value [= 980.665 cm $\sec^{-2}$].
g_p	Plate or output conductance.
g_{pg}	Grid-plate transconductance, real part of grid-plate transadmittance.
$_G$ (subscript)	Gas or vapor.
$_g$ (subscript)	Control grid: (for several grids use subscripts $_{g_1, g_2, \ldots}$, beginning at cathode) Grid injector: Use subscript $_{g_4}$ numbered from cathode. Grid screen: Use subscript $_s$ or $_{g_2}$ etc. numbered from cathode. Grid, suppressor: Use subscript $_{su}$ or $_{g_3}$, etc. numbered from cathode.
$\mathbf{H}$	Magnetic field strength or magnetic field intensity.
H	Enthalpy (heat content): per mole, total value; irradiance or radiant flux density [= $d\Phi/dA$ or dP/dA]; Boltzmann function $\left[= \sum_i n_i \ln n_i\right]$; Hamiltonian function or operator; Henry law constant.
H_M	Enthalpy (heat content) per mole.
$\mathcal{H}$	Perturbing Hamiltonian function or operator.
h	Altitude; head; height, depth and thickness; radius of lens zone; degree of hydrolysis (*solution*); enthalpy (heat content): per atom or molecule, per mole, per unit mass; Planck constant.
$\hbar$	Dirac $h[= h/2\pi]$.
h_m	Enthalpy (heat content) per atom or molecule.
h, k, l	Miller indices.
$\left.\begin{matrix} h_1[= nh] \\ h_2[= nk] \\ h_3[= nl] \end{matrix}\right\}$	Bragg reflection indices.
$_h$ (subscript)	Heater.
I	Steady direct current; conduction current; convection current; effective (rms) current); (instantaneous current); nuclear spin; nuclear spin quantum number; moment of inertia; areal moment of

English Letter Symbols (Continued)

	inertia, rectangular [$= \int y^2 dA$]; activity at time t (radioactivity); acoustic intensity (e.g., erg $cm^{-2} sec^{-1}$); candlepower or luminous intensity [$= dF/d\omega$]; integration constant of Gibbs function equation; magnetic shell strength.
$\bar{I}$	Quiescent current; average current.
$\hat{I}$	Peak current.
I_{av}	Average current.
I_m	Maximum current; maximum peak current.
I_{max}	(Maximum current).
I_{mp}	Maximum peak current.
I_p	Peak current.
I_{pk}	(Peak current).
I_s	Saturation current; total electron emission or saturation.
I_{xx} etc.	Moment of inertia.
I_{xy} etc.	Product of inertia.
I_0	Initial activity (radioactivity).
$\mathbf{i}$	Unit vector in X-direction.
i	Instantaneous current; inertia of photographic plate; vapor pressure constant; mole factor, or van't Hoff coefficient; angle of incidence or angle between ray and normal in first medium; right-angle turning operator ($= \sqrt{-1}$; use j in electric circuits); square root of minus one [$= \sqrt{-1}$ (this is the special case, where $\varphi = \pi/2$, of the operator exp $j\varphi$ which turns a vector through the angle φ; use j in elect.); imaginary unit ($= \sqrt{-1}$, same as right-angle turning operator; use j in electric circuits); vector turning operator [$= \sqrt{-1}$] (this is the special case, where $\varphi = \pi/2$, of the operator exp $j\varphi$ which turns a vector through the angle φ; use j in elec. circuits).
$\mathbf{J}$	Electric current density.
J	Variable action; number of equivalents; radiant intensity [$= d\Phi/d\omega = dP/d\omega$]; total inner quantum number; total emissive power; (moment of inertia); polar areal moment of inertia [$= \int r^2 dA$]; electric or mechanical equivalent of heat (Joule constant).
J_λ	Monochromatic emissive power; spectral radiant intensity [$= dJ/d\lambda$].
J_ν	Monochromatic emissive power.

ABBREVIATIONS AND SYMBOLS (Continued)

English Letter Symbols (Continued)

$\mathbf{j}$	Unit vector in Y-direction.
j	Inner quantum number; right-angle turning operator ($= \sqrt{-1}$; use j in electric circuits); square root of minus one $= \sqrt{-1}$ (this is the special case, where $\varphi = \pi/2$, of the operator exp $j\varphi$ which turns a vector through the angle φ; use j in elect.); imaginary unit ($= \sqrt{-1}$, same as right-angle turning operator; use j in electric circuits); vector turning operator [$= \sqrt{-1}$] (this is the special case, where $\varphi = \pi/2$, of the operator $j\varphi$ which turns a vector through the angle φ; use j in electric circuits).
K	Curvature; Kerr constant; luminous efficiency [$= F/P$, $\lambda = 5550A$]; equilibrium constant (products/reactants).
K_λ	Visibility factor, or luminosity, or monochromatic luminous efficiency [$= F_\lambda/P_\lambda = F_\lambda/\Phi_\lambda$].
K_h	Hydrolysis constant.
$\mathbf{k}$	Unit vector in Z-direction.
k	Thermal conductivity; force constant [$= -F/s$]; spring constant [$= -F/s$]; specific reaction velocity, specific reaction rate or reaction velocity constant; wave length constant [$= 2\pi/\lambda$]; torque per unit twist or tortion constant; gas constant, molecular, or Boltzmann constant; radius of gyration; load per unit displacement; restoring force per unit displacement; magnetic susceptibility; volume magnetic susceptibility [$\mathbf{M} = k\mathbf{H}$]; compressibility factor (coefficient of compressibility; reciprocal of volume modulus of elasticity).
k_g	Grid conductance at zero frequency and constant plate potential [$= (\partial i_g/\partial v_g)_{vp}$].
k_p	Plate conductance at zero frequency and constant grid potential [$= (\partial i_p/\partial v_p)_{vg}$].
L	Inductance; relative heat content; total azimuthal or orbital quantum number; length of heat flow path; Lorentz unit [$= Be/4\pi mc^2$]; Lagrange function or Lagrangian or kinetic potential [$= E_k - E_p$].
L_{12} etc.	Mutual inductance.
l	Length; free path; length of heat flow path; azimuthal or orbital quantum number; length of vibrating string, rod or tube.

ABBREVIATIONS AND SYMBOLS (Continued)
English Letter Symbols (Continued)

$\bar{l}$	Mean free path.
l_T	Tait free path.
l_0	Length rest.
l, m, n	Direction cosines.
$_L$ (subscript)	Reference to liquid.
$\mathbf{M}$	Magnetization [$= \mathbf{m}/V$]; intensity of magnetization; magnetic polarization.
M	Atomic weight; molecular weight; mutual inductance; total magnetic quantum number.
$\mathbf{m}$	Magnetic moment.
m	Modulation factor; linear magnification; (magnetic pole strength); magnetic quantum number; number of phases (elect. circuits); order of spectrum, mass (general use); mass of atom or molecule; electronic mass (use m_e when m is magnetic quantum number).
m_e	Electronic mass. (Use when m is magnetic quantum number.)
m_m	Mass of atom or molecule.
m_0	Mass rest.
$_m$ or $_{max}$ (subscript)	Maximum
$_{min}$ (subscript)	Minimum
N	Safety factor; normalization factor (probability); steradiancy [$= \mathrm{d}j/\mathrm{d}A \cos\theta$]; number of turns or of conductors; number of molecules (total); total number of lines of a grating; number of atoms or nuclei at time t (radioactivity).
$N_{1,2\ldots}$	Number of atoms or nuclei (if more than one type is considered).
$N^{o}_{1,2\ldots}$	Initial number of atoms or nuclei (if more than one type is considered).
N_0	Initial number of atoms or nuclei (radioactivity); Avogadro number (number of molecules per mole.
n	Number; number of moles; number of components (Gibbs phase rule); number of molecules per unit volume (molecular concentration); number of revolutions or rotations per unit time; principal quantum number; refractive index; rotational frequency [rev/time]; (angular frequency without damping); rigidity or shear modulus of elasticity; molecular concentration or molecular density [$= N/V$]; (order of spectrum).
n'	(Angular frequency of free vibration with damping).

ABBREVIATIONS AND SYMBOLS (Continued)
English Letter Symbols (Continued)

n_g	Group refractive index.
n_o	Loschmidt number (number of molecules per unit volume at 0°C and 1 atm).
$_n$ (subscript)	normal (perpendicular).
$\mathbf{P}$	Electric polarization.
P	Probability; power (use same system of subscripts as for current except that P, unmodified, signifies average power); active power (elect); radiant power or radiant flux [$= dU/dt$]; pressure [$= F/A$] (use P for total pressure when p represents vapor pressure; amplitude of simple harmonic pressure (acoust.).
P_i	Input power.
P_p	Plate power.
P_s	Surface polarization or strength of double layer (electric).
P_0	Static pressure.
	Output power.
$\mathbf{p}$	Total electric moment.
p	Pressure [$= F/A$] (use P for total pressure when p represents vapor pressure); osmotic pressure; vapor pressure; varying pressure; partial pressure; generalized momentum; magnetic pole strength; (partial) potential coefficient; impact parameter (Rutherford scattering formula); distance between a principal plane of a lens system and the appropriate principal plane of a unit; (angular frequency of impressed force).
p_c	Critical pressure.
$_p$ (subscript)	Plate.
Q	Electric charge; quantity of electric charge; electric quadrupole moment; thermoelectric power; quantity of heat; quantity of light or luminous energy [$= \int F dt$]; storage factor energy; Q-factor or quality factor of reactor [$= X/R$]; moment of area [$= \int y dA$]; figure of merit of inductance [$= X/R$].
q	Electric charge; quantity of electric charge; generalized coordinate; heat entering system.
R	Range (radioactivity); acoustic resistance; electric resistance; radiation resistance; thermal resistance; Rydberg constant; rotational quantum number; universal gas constant [$pV = nRT = mRT/M$; $pv_M = RT$]; (radius of tube, disk or membrane)(acoustic).

ABBREVIATIONS AND SYMBOLS (Continued)
English Letter Symbols (Continued)

$\mathcal{R}_\infty$	Rydberg constant for infinite mass.
$\mathcal{R}$	Reluctance; radiant flux density [$= \mathrm{d}\Phi/\mathrm{d}A$ or $\mathrm{d}P/\mathrm{d}A$] (when referring to a source is called radiancy, symbol $\mathcal{R}$).
$\mathbf{r}$	Position vector; radius vector.
r	Relative humidity; radial distance; radius; nuclear radius; polar coordinates; angle of reflection; angle of refraction or angle between ray and normal in second medium; specific gas constant $pv = rT$ where $v = V/m$ and $r = R/M$; specific acoustic resistance; (electric resistance).
r_p	Plate resistance.
$_r$ (subscript)	Reduced properties.
S	Area; action; total spin; spin, total quantum number (strictly speaking spin is not a quantum number); static sensitivity of phototube; reciprocal capacitance or elastance; area of cross section, walls (acoust.); effective molecular cross section; entropy: per mole, total value.
S_M	Entropy per mole.
s	Slip (elect. mach.); spin; spin quantum number (strictly speaking spin is not a quantum number); turbidity (scattering coefficient); acoustic condensation; linear distance; arc length, or path; object distance (optics); distance between object and corresponding principal plane (object distance); linear displacement; displacement in general; dynamic sensitivity of phototube; entropy: per atom or molecule; per mole, per unit mass.
s'	Image distance (optics); distance between image and corresponding principal plane (image distance).
s_m	Entropy per atom or molecule.
s_p	Transconductance at zero frequency and constant plate potential [$(= \partial i_p/\partial v_g)v_p$].
$_s$ (subscript)	Adiabatic; source; Use $_s$ or $_{g_2}$ numbered from cathode for grid, screen.
$_{su}$ (subscript)	Or $_{g_3}$ numbered from cathode for grid, suppressor.
T	Absolute (Kelvin) temperature; reverberation time; oscillation period; period of a periodic motion; half life (radioactivity); (kinetic energy); (force in a string or membrane).
T_c	Critical temperature.
T_0	Ice point; absolute temperature of ice point.

t	Ordinary temperature; time (use τ when t is used for temperature); length of prism base.
t_c	Critical temperature.
t_0	Ice point; ordinary temperature of ice point.
$_t$ (subscript)	Transition between polymorphic forms.
U	Radiant energy; potential energy; total energy; internal or intrinsic energy (thermodyn.) per mole, total value.
U_λ	Spectral radiant energy or spectral monochromatic radiant energy [$= \mathrm{d}U/\mathrm{d}\lambda$].
U_M	Internal or intrinsic energy (thermodyn.) per mole.
$\mathbf{u}$	Velocity; group velocity; linear or particle velocity; velocity at time t; (velocity components of linear or particle).
$\hat{\mathbf{u}}$	Most probable velocity.
$\bar{\mathbf{u}}$	Average velocity.
$\mathbf{u}_{av}$	Average velocity.
$\mathbf{u}_g$	Group velocity.
$\mathbf{u}_t$	Velocity at time t.
$\left.\begin{matrix}\mathbf{u}_x\\ \mathbf{u}_y\\ \mathbf{u}_z\end{matrix}\right\}$	Linear or particle components of velocity; rectangular components of velocity.
$\mathbf{u}_0$	Initial velocity.
u	Speed; linear or particle speed; speed at time t; ionic velocity (with suitable subscript); reaction velocity [$= -\mathrm{d}c/\mathrm{d}t$]; density of radiant energy = [$\mathrm{d}U/\mathrm{d}V$]; time-independent wave function; angle of slope in object space; internal or intrinsic energy (thermodyn) per unit mass; per mole, per atom or molecule.
u'	Angle of slope in image space.
$\hat{u}$	Most probable speed.
$\bar{u}$	Velocity rms; speed rms.
u_φ	Phase or wave velocity.
u_{av}	Average speed.
u_m	Internal or intrinsic energy (thermodyn) per atom or molecule.
u_t	Speed at time t.
u_w	Phase or wave velocity.
u_0	Initial speed.
V	Atomic volume; total volume; volume of a cavity or room; volume of configuration-space; molecular volume; volume per mole; voltage (see potential difference); steady d-c potential difference; rms or effective potential difference; electric

	potential, or potential difference; inne potential (metals); specific magneti rotation or Verdet constant; shearin force in beam sector; (Hamilton-Jacob equation, time dependent variable (potential energy).
V_M	Volume per mole.
$\bar{V}$	Average potential difference; quiescen potential difference.
$\hat{V}$	Peak potential and peak potential difference.
$\hat{V}_m$	Maximum peak potential difference.
V_π	Peltier potential, and Peltier potenti difference.
V_{av}	Average potential difference.
V_c	Critical volume.
V_e	Excitation potential, and excitation potential difference.
V_i	Ionization potential; inner potentia (metals).
V_m	Maximum potential difference.
$V_{\max}$	(Maximum potential difference).
V_{mp}	Maximum peak potential difference.
V_p	Peak potential and peak potential difference.
V_{pk}	Peak potential; (peak potential difference).
V_s	Seebeck potential difference.
V_t	Thomson potential difference.
V_v	Volta potential or contact potential; Volta potential difference or contact potential difference.
$\mathbf{V}$	Velocity; group velocity; linear or particle velocity; velocity at time t; (linear or particle velocity components).
$\mathbf{V}_{av}$	Average velocity.
$\mathbf{V}_g$	Group velocity.
$\mathbf{V}_t$	Velocity at time t.
$\mathbf{V}_x$ $\mathbf{V}_y$ $\mathbf{V}_z$	Rectangular components of velocity.
$\mathbf{V}_0$	Initial velocity.
$\bar{\mathbf{V}}$	Average velocity.
$\hat{\mathbf{V}}$	Most probable velocity.
v	Speed; linear or particle speed; speed at time t; velocity of sound or other waves; vibrational quantum number; instantaneous potential difference; specific volume [$= V/m$]; specific volume per unit mass; volume per mole; volume per atom or molecule.

ABBREVIATIONS AND SYMBOLS (Continued)

English Letter Symbols (Continued)

$\hat{v}$	Most probable speed.
$\bar{v}$	Average speed.
$\tilde{v}$	Rms speed; rms velocity.
v_{av}	Average speed.
v_m	Volume per atom or molecule.
v_t	Speed at time t.
v_0	Initial speed.
W	Work; work energy; (weight [= mg]); radiant flux density or radiancy or radiance [= $\mathrm{d}\Phi/\mathrm{d}A$ or $\mathrm{d}P/\mathrm{d}A$] (when referring to a source is called radiancy symbol $\mathcal{R}$); Hamilton-Jacobi equation variable, time dependent.
$\mathbf{w}$	(Linear or particle velocity components).
w	Weight [= mg]; net work function; water vapor content, or mixing ratio; (work); (work energy); (transverse displacement, acoust.); (phase or wave velocity).
w_G	Work function, gross.
X	Volume displacement (acoust.); reactance, acoustic reactance.
X_C	Capacitive reactance.
X_L	Inductive reactance.
x	Specific acoustic reactance [= XA]; distance between object and principal focus of object space.
x'	Distance between image and principal focus of image space.
x, y, z	Variable; rectangular coordinates.
x (subscript)	Solid ($x$tal).
Y	Reciprocal impedance, or admittance; Young modulus of elasticity.
y	Altitude; height, depth and thickness; object length or height (optics); super compressibility factor; (transverse displacement, acoustic).
y'	Image length or height.
y_g	Grid or input admittance with plate load [= $g_g - jb_g$].
y_p	Output admittance (plate) [= $g_p - jb_p$].
y_{pg}	Grid plate transadmittance [= $g_{pg} - jb_{pg}$].
Z	Atomic number; impedance, acoustic impedance; molecular collision frequency [= no/time]; radius of circle of least confusion; radius of image of a point; modulus of section [= I/c, where c is distance of neutral axis from extreme fiber].
z	Valence; electrochemical equivalent; specific acoustic impedance [= ZA].

ABBREVIATIONS AND SYMBOLS (Continued)

Greek Letter Symbols

$\boldsymbol{\alpha}$	Angular acceleration.
α	Attenuation constant; specific rotation $[= \theta/lc]$; most probable speed; absorption coefficient of absorbing material (acoust.); thermal coefficient of resistance; linear coefficient of thermal expansion or linear expansivity; temperature coefficient of resistance; coefficient of recombination; Sommerfeld, or fine structure, constant $[= 2\pi e^2/ch]$; end correction for a tube (acoust.); half-angle subtended at point object by objective of microscope; angular resolving power of telescope; degree of dissociation (*solutions*); degree of ionization (*solutions*); (plane angle); (most probable velocity).
β	$1/kT$; u/c; phase constant $[\gamma = \alpha + j\beta]$; relativity ratio $[= v/c]$; ratio of speed to speed of light $[= v/c]$; volume coefficient of thermal expansion or volume expansivity $[= \alpha_1 + \alpha_2 + \alpha_3]$; (plane angle).
$\boldsymbol{\Gamma}$	Reciprocal inductance.
γ	Surface tension; propagation constant $[= \alpha + j\beta]$; angular magnification $[= \tan u'/\tan u]$; specific weight or weightivity $[w/V]$; ratio of specific heats $[= c_p/c_V]$; adiabatic exponent $[pV^\gamma = \text{const.}]$; contrast of photographic emulsion; (electric conductivity).
$\boldsymbol{\Delta}$	Optical length; optical tube length; optical path difference; distance between adjacent principal foci of two lens units; finite increment.
ΔH	Heat of reaction or phase change (evaporation, fusion, sublimation, etc.) per mole, total value.
ΔH_M	Heat of reaction or phase change (evaporation, fusion, sublimation, etc.) per mole.
Δh	Heat of reaction or phase change (evaporation, fusion, sublimation, etc.) per atom or molecule, per mole; per unit mass.
Δh_m	Heat of reaction or phase change (evaporation, fusion, sublimation, etc.) per atom or molecule.
δ	Deviation; angle of deviation; frequency deviation $[= \Delta f/f_r]$; difference in phase (e.g. cm.); total thermal expansion; total elongation (deflection); galvanometer deflection; deflection of beam of

	galvanometer, etc.; beam deflections or sag; piezoelectric strain constant or modulus; increment finite.
δ_m	Minimum deviation angle.
ϵ	Emittance; self energy $[= mc^2]$; epoch angle; extinction coefficient $[= (1/cl) \log_{10} P_0/P]$; piezoelectric stress constant; average molecular kinetic energy $[= \frac{1}{2}m\bar{v}^2]$; base of natural (Naperian) logarithms [= 2.718 . . .]; capacitivity, or dielectric coefficient (dielectric constant) in cgs units; permittivity (mks units); relative dielectric coefficient, or specific inductive capacity.
ϵ'	Emissivity; total value emissivity.
ϵ_r	Capacitivity, or dielectric coefficient (dielectric constant) in mks units; relative permittivity $[= \epsilon/\epsilon_0]$; relative dielectric coefficient, or specific inductive capacity.
ϵ_t'	Total value emissivity.
$\epsilon\lambda$	Monochromatic emissivity (color spectral).
ϵ_0	Permittivity of free space (mks units; see capacitivity).
ζ	Displacement of sound bearing particle; displacement components (of sound bearing particle).
η	Efficiency; coefficient of viscosity; displacement components of sound bearing particles; transverse displacement (acoust.); electric susceptibility $[\mathbf{P} = \eta\mathbf{E}]$.
ηV	Voltage efficiency $[= V_{\text{theor}}/V_{\text{actual}}]$ (*electrolysis.*)
Θ	Debye characteristic temperature; (Kelvin or absolute temperature).
θ	Angle of contact; angle of optical rotation; angle of diffraction; plane angle; glancing angle; angular displacement; angular distance; (ordinary temperature) polar coordinates.
κ	Absorption index $[= (\lambda/4\pi x) \ln P_0/P]$.
Λ	Permeance $= L/N^2$; Nuclear dissociation energy; equivalent conductivity (mho/equivalent).
λ	Decay constant $[N = N_0 \exp (-\lambda t)]$; disintegration constant $[N = N_0\epsilon - \lambda t]$ linear density (mass/length); charge density, linear; mass per unit length; wave length; free path.
$\bar{\lambda}$	Mean free path.
λ_e	Effective wave length.

Greek Letter Symbols (Continued)

λ_T	Tait free path.
λ (subscript)	Monochromatic; spectral.
μ	Inductivity, or absolute or magnetic permeability; gas amplification factor (photoelectric tubes); partial molal, or chemical potential Gibbs function [$= \partial G/\partial n$]; reduced mass $1/\mu = (1/m_1) + (1/m_2)$; coefficient of friction; sliding or kinetic coefficient of friction (use f when μ designates the Poisson ratio); grid control ratio (thyratrons); molecular conductivity (mho/mole); electric moment of atom, dipole molecule or dipole; magnetic moment of atom, molecule or dipole; amplification factor [$= -(\partial e_p/\partial e_g)i_p$]; Joule-Thomson (Kelvin) coefficient [$= \partial T/\partial p_H$]; Poisson ratio; (coefficient of diffusion (fluid)); (refractive index).
μ_I	Nuclear magneton [$= \mu_0/1838$].
μ_e	Electric moment of atom, dipole molecule, or dipole.
μ_g	(Refractive index group).
μ_k	(Sliding or kinetic coefficient of friction (use f when μ designates Poisson ratio)).
μ_m	Magnetic moment of atom, molecule or dipole.
μ_r	Relative magnetic permeability [$= \mu/\mu_0$ mks units]; coefficient of rolling friction (use f when μ designates Poisson ratio).
μ_s	Starting or static coefficient of friction (use f when μ designates the Poisson ratio).
μ_0	Bohr or orbital magneton [$= eh/4\pi mc$].
ν	Reluctivity [$= 1/\mu$]; permeability of free space reciprocal permeability; reciprocal of dispersive power; frequency (optics, quantum theory); coefficient of kinematic viscosity [$= \eta/\rho$]; Poisson ratio.
ν_0	Photoelectric threshold frequency.
Ξ	Propagation flux density.
ξ	Longitudinal displacement (acoust); displacement or displacement components of sound bearing particle; (transverse displacement (acoust.).
Π	Osmotic pressure; Peltier coefficient; Poynting vector; Hertzian vector.
π	(Osmotic pressure).
ρ	Density [$= m/V$]; vapor density; volume electric charge density; mass per unit volume (density); reflectance, or reflection factor [$= P/P_0$]; specific resistance

Greek Letter Symbols (Continued)

	or resistivity; absolute humidity; radius of curvature; (linear density, [mass/length]); (surface density [m/A); (mass per unit area); (mass per unit length).
ρv	Convection current.
ρ'	Reflectivity.
Σ	Exposure [$= Et$]; Summation Operator.
σ	Surface density m/A; dispersion [$= \mathrm{d}n/\mathrm{d}\lambda$]; area; mass per unit area; slip (elect. mach.); surface tension; electric conductivity; surface charge density; conductivity of an opening (acoust.); specific magnetization [$= \mathbf{m}/\sigma$]; magnetic leakage coefficient; wave number; effective molecular cross section; molecular diameter (collision); Stefan-Boltzmann constant [$= \mathrm{R}/\cdot \mathrm{T}_4$]; radiation law constants (see Stefan-Boltzmann); Thomson coefficient.
$\boldsymbol{\tau}$	Vector unit tangent to path.
τ	Transmittance or optical transmittance or transmission factor [$= P/P_0$]; time constant; mean life (radioactivity); decay modulus [$s = A \cos (\omega t + \varphi) \exp (-t/\tau)$; dew point temperature; (time, use when t is used for temperature); (total volume).
Φ	Magnetic flux or magnetic flux of induction [$= \int \mathbf{B} \cdot \mathrm{d}A$]; radiant power, or radiant flux [$= \mathrm{d}U/\mathrm{d}T$].
φ	Fluidity (reciprocal of viscosity); net work function per unit charge, or electron affinity [$\mathrm{d}\varphi = dw/de$ volts]; electromagnetic scalar potential; potential velocity (hydrodyn); electron affinity [$= w/e$, volts]; phase angle; angle of incidence or angle between ray and normal in first medium; (epoch angle).
φ_c	Critical angle.
φ_g	Work function per unit charge, gross, or gross electron affinity [$d\varphi_g = dw_g/de$, volts]; electron affinity, gross [$= w_g/e$, volts].
φ'	Angle of refraction or angle between ray and normal in second medium.
$\bar{\varphi}$	Polarizing angle or principal angle of incidence in dielectrics.
χ	Specific magnetic susceptibility [$= k/\sigma$].
Ψ	Total flux of electric displacement [$= \int \mathbf{D} \cdot \mathrm{d}\mathbf{A}$]; electric flux of induction [$= \int \mathbf{D} \cdot$

	d**A**]; electric or total electric (dielectric) flux [$= \int \mathbf{D} \cdot d\mathbf{A}$]; Planck function [$= -A/T$].
ψ	Time dependent wave function; Azimuth angle (optics).
$\bar{\psi}$	Principal azimuth angle.
Ω	Volume of phase space.
ω	Solid angle; pulsatance or periodicity [$= 2\pi f$]; angular speed; angular velocity; angular frequency [$= 2\pi f$, radians/time]; angular frequency of impressed force; angular frequency without damping; circular frequency [$= 2\pi f$]; dispersive power [$= (n_F - n_C)(n_D - 1)$]; specific magnetic rotation, or Verdet constant.
ω'	Angular frequency of free vibration with damping.
ω_r	Resonant periodicity.

Miscellaneous Symbols

$\cdots$ (superscripts)	Time derivatives, dots used over symbol.
$1/k$	Thermal resistivity.
M/z	Equivalent weight (chem).

AMERICAN STANDARD ABBREVIATIONS FOR SCIENTIFIC AND ENGINEERING TERMS

Reproduced by permission of The American Society of Mechanical Engineers

Introductory Notes

Scope and Purpose

1. The Executive Committee of the Sectional Committee on Scientific and Engineering Symbols and Abbreviations has made the following distinction between symbols and abbreviations: Letter symbols are letters used to represent magnitudes of physical quantities in equations and mathematical formulas. Abbreviations are shortened forms of names or expressions employed in texts and tabulations, and should not be used in equations.

Fundamental Rules

2. Abbreviations should be used sparingly in text and with due regard to the context and to the training of the reader. Terms denoting units of measurement should be abbreviated in the text only when preceded by the amounts indicated in numerals; thus "several inches," "one inch," "12 in." In tabular matter, specifications, maps, drawings, and texts for special purposes, the use of abbreviations should be governed only by the desirability of conserving space.

3. Short words such as ton, day, and mile should be spelled out.

4. Abbreviations should not be used where the meaning will not be clear. In case of doubt, spell out.

5. The same abbreviation is used for both singular and plural, as "bbl" for barrel and barrels.

6. The use of conventional signs for abbreviations in text is not recommended; thus "per," not /; "lb," not #; "in," not ″. Such signs may be used sparingly in tables and similar places for conserving space.

7. The period should be omitted except in cases where the omission would result in confusion.

8. The letters of such abbreviations as ASA should not be spaced (not A S A).

9. The use in text of exponents for the abbreviations of square and cube and of the negative exponents for terms involving "per" is not recommended. The superior figures are usually not available on the keyboards of typesetting and linotype machines and conposition is therefore delayed. There is also the liklihood of confusion with footnote reference numbers. These shorter forms are permissible in tables and are sometimes difficult to avoid in text.

10. A sentence should not begin with a numeral followed by an abbreviation. Abbreviations for names of units are to be used only after numerical values, such as 25 ft or 110 v.

AMERICAN STANDARD ABBREVIATIONS (Continued)

Abbreviations*

absolute	abs
acre	spell out
acre-foot	acre-ft
air horsepower	air hp
alternating-current (as adjective)	a-c
ampere	amp
ampere-hour	amp-hr
amplitude, an elliptic function	am.
Angstrom unit	A
antilogarithm	antilog
atmosphere	atm
atomic weight	at. wt
average	avg
avoirdupois	avdp
azimuth	az or α

barometer	bar.
barrel	bbl
Baumé	Bé
board feet (feet board measure)	fbm
boiler pressure	spell out
boiling point	bp
brake horsepower	bhp
brake horsepower-hour	bhp-hr
Brinell hardness number	Bhn
British thermal unit[1]	Btu or B
bushel	bu

calorie	cal
candle	c
candle-hour	c-hr
candlepower	cp
cent	c or ¢
center to center	c to c
centigram	cg
centiliter	cl
centimeter	cm
centimeter-gram-second (system)	cgs
chemical	chem
chemically pure	cp
circular	cir
circular mils	cir mils
coefficient	coef
cologarithm	colog

---

* These forms are recommended for readers whose familiarity with the terms used makes possible a maximum of abbreviations. For other classes of readers editors may wish to use less contracted combinations made up from this list. For example, the list gives the abbreviation of the term "feet per second" as "fps." To some readers ft per sec will be more easily understood.

[1] Abbreviation recommended by the A.S.M.E. Power Test Codes Committee. B = 1 Btu, kB = 1000 Btu, mB = 1,000,000 Btu. The A.S.H.&V.E. recommends the use of Mb = 1000 Btu and Mbh = 1000 Btu per hr.

AMERICAN STANDARD ABBREVIATIONS (Continued)

concentrate	conc
conductivity	cond
constant	const
continental horsepower	cont hp
cord	cd
cosecant	csc
cosine	cos
cosine of the amplitude, an elliptic function	cn
cost, insurance, and freight	cif
cotangent	cot
coulomb	spell out
counter electromotive force	cemf
cubic	cu
cubic centimeter	cu cm, cm^3 (liquid, meaning milliliter, ml)
cubic foot	cu ft
cubic feet per minute	cfm
cubic feet per second	cfs
cubic inch	cu in.
cubic meter	cu m or m^3
cubic micron	cu μ or cu mu or μ^3
cubic millimeter	cu mm or mm^3
cubic yard	cu yd
current density	spell out
cycles per second	spell out or c
cylinder	cyl

day	spell out
decibel	db
degree[1]	deg or °
degree centigrade	C
degree Fahrenheit	F
degree Kelvin	K
degree Réaumur	R
delta amplitude, an elliptic function	dn
diameter	diam
direct-current (as adjective)	d-c
dollar	$
dozen	doz
dram	dr

efficiency	eff
electric	elec
electromotive force	emf
elevation	el
equation	eq
external	ext

---

[1] There are circumstances under which one or the other of these forms is preferred. In general the sign ° is used where space conditions make it necessary, as in tabular matter, and when abbreviations are cumbersome, as in some angular measurements, i.e., 59° 23′ 42″. In the interest of simplicity and clarity the Committee has recommended that the abbreviation for the temperature scale, F, C, K, etc., always be included in expressions for numerical temperatures, but, wherever feasible, the abbreviation for "degree" be omitted; as 69 F.

AMERICAN STANDARD ABBREVIATIONS (Continued)

farad	spell out or f
feet board measure (board feet)	fbm
feet per minute	fpm
feet per second	fps
fluid	fl
foot	ft
foot-candle	ft-c
foot-Lambert	ft-L
foot-pound	ft-lb
foot-pound-second (system)	fps
foot-second (see cubic feet per second)	
franc	fr
free aboard ship	spell out
free alongside ship	spell out
free on board	fob
freezing point	fp
frequency	spell out
fusion point	fnp
gallon	gal
gallons per minute	gpm
gallons per second	gps
grain	spell out
gram	g
gram-calorie	g-cal
greatest common divisor	gcd
haversine	hav
hectare	ha
henry	h
high-pressure (adjective)	h-p
hogshead	hhd
horsepower	hp
horsepower-hour	hp-hr
hour	hr
hour (in astronomical tables)	h
hundred	C
hundredweight (112 lb)	cwt
hyperbolic cosine	cosh
hyperbolic sine	sinh
hyperbolic tangent	tanh
inch	in.
inch-pound	in-lb
inches per second	ips
indicated horsepower	ihp
indicated horsepower-hour	ihp-hr
inside diameter	ID
intermediate-pressure (adjective)	i-p
internal	int
joule	j

AMERICAN STANDARD ABBREVIATIONS (Continued)

kilocalorie	kcal
kilocycles per second	kc
kilogram	kg
kilogram-calorie	kg-cal
kilogram-meter	kg-m
kilograms per cubic meter	kg per cu m or kg/m^3
kilograms per second	kgps
kiloliter	kl
kilometer	km
kilometers per second	kmps
kilovolt	kv
kilovolt-ampere	kva
kilowatt	kw
kilowatthour	kwhr

lambert	L
latitude	lat or ϕ
least common multiple	lcm
linear foot	lin ft
liquid	liq
lira	spell out
liter	l
logarithm (common)	log
logarithm (natural)	$\log_e$ or ln
longitude	long. or λ
low-pressure (as adjective)	l-p
lumen	l*
lumen-hour	l-hr*
lumens per watt	lpw

mass	spell out
mathematics (ical)	math
maximum	max
mean effective pressure	mep
mean horizontal candlepower	mhcp
megacycle	spell out
megohm	spell out
melting point	mp
meter	m
meter-kilogram	m-kg
mho	spell out
microampere	μa or mu a
microfarad	μf
microinch	μin.
micromicrofarad	μμf
micromicron	μμ or mu mu
micron	μ or mu

---

* The International Commission on Illumination has changed the symbol for lumen to lm, and the symbol for lumen-hour to lm-hr. This nomenclature is used in American Standard for Illuminating Engineering Nomenclature and Photometric Standards (ASA Z7.1–1942).

AMERICAN STANDARD ABBREVIATIONS (Continued)

microvolt	μv
microwatt	μw or mu w
mile	spell out
miles per hour	mph
miles per hour per second	mphps
milliampere	ma
milligram	mg
millihenry	mh
millilambert	mL
milliliter	ml
millimeter	mm
millimicron	mμ or m mu
million	spell out
million gallons per day	mgd
millivolt	mv
minimum	min
minute	min
minute (angular measure)	′
minute (time)(in astronomical tables)	m
mole	spell out
molecular weight	mol. wt
month	spell out

National Electrical Code	NEC

ohm	spell out or Ω
ohm-centimeter	ohm-cm
ounce	oz
ounce-foot	oz-ft
ounce-inch	oz-in.
outside diameter	OD

parts per million	ppm
peck	pk
penny (pence)	d
pennyweight	dwt
per	(See Fundamental Rules)
peso	spell out
pint	pt
potential	spell out
potential difference	spell out
pound	lb
pound-foot	lb-ft
pound-inch	lb-in.
pound sterling	£
pounds per brake horsepower-hour	lb per bhp-hr
pounds per cubic foot	lb per cu ft
pounds per square foot	psf
pounds per square inch	psi
pounds per square inch absolute	psia
power factor	spell out or pf

quart	qt

AMERICAN STANDARD ABBREVIATIONS (Continued)

radian	spell out
reactive kilovolt-ampere	kvar
reactive volt-ampere	var
revolutions per minute	rpm
revolutions per second	rps
rod	spell out
root mean square	rms
secant	sec
second	sec
second (angular measure)	″
second-foot (see cubic feet per second)	
second (time)(in astronomical tables)	s
shaft horsepower	shp
shilling	s
sine	sin
sine of the amplitude, an elliptic function	sn
specific gravity	sp gr
specific heat	sp ht
spherical candle power	scp
square	sq
square centimeter	sq cm or cm^2
square foot	sq ft
square inch	sq in.
square kilometer	sq km or km^2
square meter	sq m or m^2
square micron	sq μ or sq mu or μ^2
square millimeter	sq mm or mm^2
square root of mean square	rms
standard	std
stere	s
tangent	tan
temperature	temp
tensile strength	ts
thousand	M
thousand foot-pounds	kip-ft
thousand pound	kip
ton	spell out
ton-mile	spell out
versed sine	vers
volt	v
volt-ampere	va
volt-coulomb	spell out
watt	w
watthour	whr
watts per candle	wpc
week	spell out
weight	wt
yard	yd
year	yr

Pound, unit of mass, definition 3107
Poundal, " " force, " 3093
Pounds and tons in use in United States, metric equivalents 3195–3197
Power, definition, units, equation 3115
" developed by a current, equations 3115
" factor, definition 3115
" ratios, " 3115
" , thermoelectric, definition 3128
" , " , table 2638–2639
" , units and conversion factors 3169
Powers and roots, formulas 293
" of numbers, 4th to 8th inclusive, table 202–203
" " " , squares, cubes and roots 182–201
" " " , use of table 9
" " two 204
Precipitation or solubility product, definition 3122
Prefix names of organic radicals 747–751
Preparation of laboratory reagents 1643–1663
Pressure, absolute, definition 3116
" , definition, equation 3116
" of the Earth's atmosphere at elevations up to 160 kilometers 3370
" , osmotic, of aqueous solutions, table 2171
" , units and conversion factors 3165–3167; 3188
" " , conversion table for 3188
" , vapor 2324–2430
Prestone and water, freezing point of 2311
Primary color sensations by different wave lengths, relative stimulation of 2949
" standards for volumetric analysis 1675–1676
Prime numbers, logarithms of 238–245
Principal constants and ratios, general physical 3376–3381
" focus, definition 3116
" lines in the emission spectra of the elements 2747–2903
" of least time, Fermat's 3092
Prism, index of refraction by minimum deviation, equation 3108
" , surface and volume, formulas 316
Prismoidal formula for volumes 318
Probability, formulas 310–311

“ , units and conversion factors ... 3186
Sylvine, index of refraction ... 2934
“ , transmissibility for radiations ... 2999
Symbols and abbreviations for chemistry and physics ... 3387–3406
“ for fundamental particles ... 3385–3386
“ of the elements ... 401–402; 405–436
Synonym index of inorganic compounds ... 520–525
“ “ “ minerals ... 1502–1503
Synonyms and common names of alloys ... 1520–1532
“ , common minerals ... 1504–1519
“ , “ names of chemicals ... 1565–1570
“ , organic compounds ... 764–1403
Synthetic and natural fats, oils and waxes, constants of ... 1460–1471
“ “ “ rubber stocks, physical properties of ... 1552–1554

T

Tabulation of C° Centigrade, T° Kelvin, and 1000/T from −210 to +210°C ... 3232–3234
Tangent galvanometer, equations ... 3126
Tannic acid, specific gravity of aqueous solutions ... 2059
Tartaric “ , “ “ “ “ “ ... 2060
Taylor's series ... 296
Temperature coefficient of resistivity ... 2594–2596
“ , color scale of ... 2284
“ correction for barometric readings, brass scale, English units ... 2482–2483
“ correction for barometric readings, brass scale, metric units ... 2480–2481
“ correction for glass volumetric apparatus ... 2109
“ “ “ volumetric solutions ... 2108
“ , definition ... 3126
“ , gas thermometer to thermodynamic, reduction table ... 3230
“ , liquid “ “ “ , “ “ ... 3230
“ of saturated steam ... 2442–2445
“ resistance coefficient, definition ... 3127
“ scale, absolute or thermodynamic, definition ... 3135
“ scales, conversion table, Centigrade-Kelvin ... 3232–3234
“ , standard scale of, definition ... 3135
“ , units and conversion factors ... 3172
Temperatures, centigrade to Fahrenheit, conversion table ... 3235–3252
“ , high and low ... 2474
“ of the Earth's atmosphere at elevations up to 160 kilometers ... 3370
“ , transition, superconducting ... 2597
Tensile strength of metals ... 2135
Tension, surface ... 2137–2153
Terrestrial magnetism, constants of ... 2656
t test of significance between two sample means ... 215–217
“ “ “ “ , table ... 215–217
Tests, flame and bead ... 1641–1642
“ of significance and for equality of variances, explanation ... 215
Theories, chemical ... 3067–3134
Thermal capacity of a substance, definition ... 3127
“ “ or water equivalent, “ ... 3127
“ conductivity, definition ... 3080
